"These observations confirmed my opinion that these symptoms could be explained as the reflexes from abnormally stimulated centripetal nerves of the alimentary tract to inhibitory nerves to different tissues It was assumed that the metabolism of every tissue was regulated by special centrifugal nerves by two opposing principles One set of nerves augments, the other diminishes its vitality, and if extremely irritated destroys altogether the resistance of the tissue"

Pavlov states that the manifestations of shock in his experimental animals substantiate this claim[3] Over a course of many years in his laboratory he noted that frequently after gastro-intestinal operations the animals

* These terms were introduced by Engelmann to designate the processes of strength conductivity, irritability, and tone respectively of

developed either one of two things—shock or trophic disturbances, such as tetany or paresis Pavlov and Rosenthal have lately repeated these experiments in order to find out the cause of the phenomena of shock or trophic disorder In their operations they produced the same tension as was produced before in the nerves by transplanting and fixing different parts of the alimentary tract, without, however, breaking its continuity In this way gastro-intestinal secretions which were lost in the previous operations, were retained, and thus the possible effect of loss of secretion on trophic disorder was eliminated Under these conditions identical symptoms of shock or trophic lesions (for example, in the skin and oral mucous membrane) occurred Pavlov explains these two sets of occurrences (shock and trophic) as reflexes, the abnormally stimulated alimentary nerves constitute the afferent arc, and the trophic (inhibitory) nerves to different tissues the efferent arc He says 'The reflex irritation when it acts quickly on the inhibitory nerves produces the symptoms of shock, when this reflex irritation acts more weakly over a long period it produces chronic pathological changes (trophic) in the tissues'"

Heart

Forty years ago physiologists proved that besides the inhibitory (vagus) and accelerator (sympathetic) nerves to the heart there is another pair of cardiac nerves, also antagonistic, which act on the vital activity of the cardiac muscle One of these nerves makes the cardiac beat stronger by increasing the irritability, removing dissociation, and quickening systole, the other acts in a diametrically opposed way These nerves cannot be vasomotors, because the action is seen if the heart is excised and, therefore, bloodless, the conclusion is that they are trophic nerves

Salivary Glands

The existence of a trophic nerve to the salivary glands, which was first proved by Heidenhain many years ago, has been recently confirmed by the work of one of Pavlov's pupils (Professor B P Babkin) [10] These workers found that there were two kinds of nerves to the salivary glands one excites its general excretory activity, and the other (trophic) affects the organic content of the saliva In the salivary glands the trophic nerves act only to augment the organic content of the saliva, and there *is no antagonistic* or inhibitory nerve here

Clinical Evidence

Professor Pavlov says that clinical medicine offers many examples of trophic disturbances which *physiology cannot* at present explain, but which in all probability will be shown to depend upon the existence of *trophic nerves* He explains the following as reflexes through the trophic nerves *skin eruptions* produced, especially in children, by alimentary disturbances, and, vice versa, the *production* of internal lesions of the pleura, lungs, kidney, etc, by certain skin injuries, softening of bones noted by Pavlov in his dogs when damp cold is continually applied to the skin, the favourable internal results from warm compresses, mustard plasters, cupping, the coating of the tongue from indigestion the favourable balance of metabolism in the heart and brain and their preservation from wasting during starvation He goes on to say

> All the above mentioned would be understandable *in their* mechanism if we admitted an antagonistic pair of trophic nerves which either augmented or diminished the metabolism of the tissues Then those would be cases of reflex irritation of such nerves when the inhibitory trophic nerve is excessively irritated the vitality of the tissue is lowered and disease results when the positive trophic nerves are stimulated the vitality of the tissue is increased so that it may overthrow the pathological agent "

In regard to the furring of the tongue he writes

> There is not always an uninterrupted pathologic process from the stomach to the mouth A disorder of the stomach or the alimentary tract may create an irritator for a reflex for the inhibitor-trophic nerve of the mucous membrane of the mouth especially of the tongue whereby it is put into an abnormal state which leads by degrees to loss of taste Loss of taste leads to abstention from food which gives a rest to the alimentary tract and *constitutes* the chief therapeutical measure against such a disorder Thus there might be here a self healing process on behalf of the organism

> In starvation It may be supposed that in the heart and brain *by means of the necessary reflexes* upon their positive trophic nerve the normal energy of the vital chemical processes is kept up while in all the other organs it is hindered and certain which lead to their rapid atrophy From this point of view a pair of trophic nerves would be the last direct distributor of the nutritive resources of the organism to its different parts

The we would suppose that every organ has under a triple nervous control (1) functional nerves which may be inhibitors or excitors—for example those nerves which produce contraction of muscle or the secretion of a gland or inhibition of both of these functions (2) vasomotor nerves which regulate the blood carriage of *chemical* materials and the tissue-aware of reflex augmenting or diminishing the flow of blood to the organ (3) trophic nerves which determine in the interior of the organism as a whole the exact quantity of material utilized by every organ Such triple control we can conceive proved in the heart "

BABKIN'S WORK ON THE SALIVARY GLANDS AND DIGESTIVE TRACT

The work of B P Babkin (now of Washington University Medical School, St Louis) on the salivary glands and digestive tract brings out some interesting facts *about* the sympathetic system This work was carried on for ten years in Leningrad (Petrograd) under Pavlov Babkin has worked out the meaning of double innervation of glands, the effect of sympathetic stimulation on secretion, and the idea of a relativity of function applied to physiological organs *

As a result of his experiments on the innervation of the salivary glands, Babkin came to the conclusion that 'trophic *impulses pass to the submaxillary gland or a dog through* the sympathetic nerve as well as through the parasympathetic, showing that different impulses may pass through one and the same nerve Normal amounts of the organic substances have been found in the saliva after extirpation of the *superior cervical ganglion* This led him and his co-workers to investigate the meaning of the sympathetic innervation of the salivary glands They found that for the work of the sympathetic nerve special conditions must be brought about in the gland The effect *produced by stimulation of the sympathetic is at its* maximum when the gland has already been put in a state of excitation (by various methods such as cutting the chorda tympani, stimulating other nerves, or using pilocarpin)

What causes the gland to work more actively under sympathetic stimulation during a state of excitation? It is probable that this is due to a change in the surrounding medium (blood or lymph) of the gland cells, produced by the 'excitation" of the cells In fact, he has shown this by injecting acid and alkali into the blood, under these conditions the secretion of the gland after sympathetic stimulation is different from what it would be if the blood had not been altered Also peristalsis of the gastro-intestinal tract depends not only on the mechanical or chemical stimulus but on the condition of the blood, *this Babkin demonstrated by injecting acid or alkali into* the blood By "relativity of function" he means that the function of an organ depends not only on the stimulus applied to it, but on the condition of the organ, and this condition depends in turn upon the composition of the surrounding medium "Since in normal conditions (and especially in pathologic cases) changes of the surrounding medium occur, the idea of a relativity of function may be of use in physiology as well as in pathology "[11]

IONIC THEORY OF STIMULATION

Somewhat related to this work is the ionic theory of stimulation worked out by Professor P Lazareff of the University of Moscow This theory is based on the observations of Jacques and Nernst, made about twenty years ago Working independently they found that "in the nerve and in the muscle the change from the state of rest to that of excitation is brought about by changes in the ionic concentration of the medium" Lazareff has demonstrated that in all organs, under all conditions, excitation is possible only as a consequence of changes in the ionic concentration of the medium Whenever these changes are not present, excitation is not possible

---

For the statements in regard to this work I am indebted to Dr Babkin for his extreme kindness in giving me access to an unpublished paper summarizing his entire work and his personal explanations of certain parts of this work Full details will be given later in his publications to appear shortly

From these facts a general law of excitation for the threshold of irritability was formulated He says

"Calculating in every case the possible changes in ionic concentration, we were able to explain the laws of Pfluger, to develop further a theory of nervous excitation, to formulate a theory of muscular excitation, a theory of vision, a theory of hearing and of taste, and very recently to develop laws of the function of the central nervous system (of the brain)"[17]

FATIGUE OF THE EYE

In his work on vision Lasareff found that in fatigue of the eye by stimulation there was no fatigue of the brain centres This was tested directly by stimulation of the optic nerve electrically after the eye had been exposed to stimulation by light, and a second time when the eye had been left in darkness for some time and therefore at rest, the results were the same This led him to the conclusion that the brain centres are indefatigable, and that in the absence of stimulation the organism will not become fatigued, although it may fall into a state of sleep from the prolonged absence of stimulation This indefatigability of the centres bears an intimate relation to the periodicity of the function of the centres This periodicity is caused by periodic chemical reactions taking place in the nerve centres, which give rise to periodic electromotive forces[20]

GASTRO-INTESTINAL TRACT

Snotinin, working in Pavlov's laboratory, has shown that subcutaneous injections of adrenaline have a marked effect on Heidenhain's pouch in the dog, the HCl content is greatly increased Folborth, in Pavlov's laboratory at the Military Medical Academy, has also recently demonstrated that the sympathetic nerve has a direct secretory action on the gastric glands, by electric stimulation of the splanchnic nerve (cut five or seven days previously in order that the vaso-constrictors might have time to degenerate) in a dog with a Pavlov's pouch Clinical results of adrenaline in cases of achylia gastrica were being tried out in the hospitals of Leningrad, but they had not borne out the physiological work at the time that I left (July, 1923)[16]

METABOLISM OF CHOLESTEROL

During the past fifteen years a considerable amount of work has been done by Anitschkov and S S Chalatov of the Leningrad Medical Institute on the metabolism of cholesterol (in addition to what has been done in this country by Gardner, Dore, Ellis, McNee, and others) Chalatov showed that when the yolk of egg, brains, or pure cholesterol dissolved in sun-flower oil, is given to rabbits by the mouth anisotropic fat is deposited in various tissues, but principally in the intima of the aorta In these animals the presence of anisotropic fat induces later pathological changes, such as hepatic cirrhosis and fibrosis of the spleen Professor Chalatov found that these deposits did not occur in omnivorous animals (rats) unless there was some other toxic agent acting at the same time[29] Later investigations of Chalatov, since 1922, in human beings, using his new method of estimating the blood cholesterol, have shown that the cholesterol diathesis in man appears especially under the influence of syphilis[30] The conditions formerly described as atheromatosis is explained by Chalatov as due to deposits of anisotropic fats in the arteries, to which he applies the term "xanthomatosis"[31]*

COLOUR VISION

Another work which may be of great value to psychology and brain physiology is that being done by Krasnogorsky, a former pupil of Pavlov During the spring of this year (1924) he showed that in hypnotized children real colours and suggested colours are blended to form the complementary colour The experiments have been carried out in the following way an uneducated child, knowing nothing of the laws of physics, is hypnotized and shown a certain colour—for example, yellow It is asked to name the colour before it This it does correctly Then it is told that it has answered wrong, that the colour is not yellow but blue In a few moments it is asked again to name the colour that it has been shown It names neither the real colour nor the suggested colour, but the complementary colour of the two The work has been verified several times and brought to the attention of Pavlov, who, I hear, suggests that it may eventually be shown that the same chemical neural process is set up in the brain by the mental suggestion of the fictitious colour as is set up by the real colour through the optic nerve[18]

CONCLUSION

In these remarks about science in Russia I have given my impression of the official attitude of the Soviet Government toward science and cited some representative facts of scientific accomplishments, particularly in the field of medical science A complete review of medical science has not been attempted Also nothing has been said of the position of the scientists themselves, which will be discussed in a later article

ROYAL MEDICAL BENEVOLENT FUND

At the last meeting of the committee thirty-five cases were considered and £507 10s voted to thirty-four applicants The following is a summary of some of the new cases relieved

Daughter, aged 60, of M R C S Eng who died in 1869 Has had no regular work since 1923 and is now considered too old for the posts she applies for From 1915 to 1923 was nurse at a rescue maternity home but lost her post owing to reorganization of the staff Applicant has one month's temporary work in view at 15s a week Voted £6 in twelve instalments

Widow, aged 72, of M D who died in 1894 An annuity of £40 from Liverpool Merchants' Guild is her only income apart from money received for knitting She lives with two unmarried sisters who are not well off Voted £26 in twelve instalments

Daughter, aged 37, of L R C P Edin who died in 1911 Suffers from epilepsy and is looked after by a sister whose only income is £17 10 a year, the same as the applicant's Applicant is only able to do temporary light clerical work at times, and the last twelve months only earned £8 10s Voted £15

Daughter, aged 82, of M R C S Eng who died in 1892 Applicant opened a home of rest for young women and carried it on until 1922 when her health broke down She now lives in one room in her sister's house and all she has to depend on is the old age pension 8s a week and interest on £100 War Bond Voted £10

Subscriptions may be sent to the Honorary Treasurer, Sir Charters Symonds, K B E, C B, M S, at 11, Chandos Street Cavendish Square, London, W 1

THE MODERN APPLICATION OF THE ROMAN SYSTEM OF HEATING BUILDINGS

If there is one thing certain about the life of the Romans, both in their own country and in this, it is that they heated their houses and the water for their baths The recent uncovering of a Roman dwelling at Folkestone in which the hypocaust is well preserved has reminded us of the pains the Romans took to warm the *floors* of their houses by the products of the combustion of a furnace passing continuously below them But they did more than that, for they warmed the walls by means of hot air passed through hollow bricks built into the interior The floor of a *Roman house, in fact,* was not laid on the ground, but on the top of a large number of low pillars composed of tiles—flat bricks—or stones, around and between which the hot air circulated The more perfectly the villa is preserved the more certain are we to find the hypocaust The walls were evidently heated by *means of ducts or flues* formed by hollow rectangular bricks, of which excellent examples are to be found at the baths of Caracalla at Rome and at Bath in this country

The heating of a house is not nearly so simple a problem as might be supposed nor do we nowadays consider that we have solved it merely by lighting a coal fire in an open grate

Some of the conditions to be fulnlled are as *follows*

1 The temperature of the air furthest from the fire should be about 65° F

2 This air should be neither too moist nor too dry

3 The air should be capable of being changed with*out creating a draught*

4 Dust should not be introduced into the incoming air and should not reach it from the source of heat

The wastefulness of the ordinary old fashioned, wholly metal grate placed vertically below a wide chimney is painful to contemplate, for about 90 per cent of its heat goes up the chimney By bringing the fire box well out on to the hearthstone, by having the fire-brick sloping so as to *reflect heat out into the* room, and by other modifications, about 60 per cent of the radiant heat may be induced to enter the room The two problems of heating and ventilating though they have to be solved together, are as problems in physics, quite distinct, for we can heat without ventilating and ventilate without heating We heat without ventilating in practically every system which makes no provision for the ingress of pure air and the egress of used air Nearly all so-called "central" heating systems come under this description, the exception being the system in which incoming air, having been washed, is thereafter heated on its way to the rooms We ventilate without heating when we open the door and windows and have perflation, and we ventilate *without* much heating when we have an open fire burning

To heat air which is not being changed is to create "stuffiness," which is the smell of volatilized organic matter It is this stuffiness that the typical Briton objects to so much, and of which he complains in houses heated by any process which does not also provide for ventilation

People object to the odour of hot stagnant air, not really to its warmth, but it is always the heat which is blamed, whereas the fault lies in the volatilized dust in the air, the air is being heated but is not being changed Thus people forget that a cold, damp room with its stagnant air can have stuffiness latent in it It is a very common fallacy to assume that because a room is warm its air must be impure, and that if cold it must be pure Hence the British traveller in Canada and the United States condemns at first sight the radiators in the houses and hotels as being unpleasant and unhealthy What he really means is not that the temperature attained is unhealthy, but that the hot water or steam pipes are installed in apartments in which no provision is made for the changing of the air, which in consequence rapidly becomes 'stuffy"

As far as Canada is concerned this condemnation applies to the ordinary citizen's dwelling and to a great many hotels and public buildings There are, it should be mentioned, several *notable* exceptions, such as the Chateau Laurier Hotel, Ottawa, where the system of ventilation is practically perfect, and the absence of the slightest trace of stuffiness, of the smell of cooking or of tobacco smoke is remarkable

In a few Canadian houses some of the rooms are provided with open fires as well as with radiators the former sufficing to ventilate the rooms In some large English houses also the two systems are combined, but in these days of difficulty in regard to domestic service the multiplication of coal fires is not a popular institution Gas fires, when in communication with efficient flues can advantageously take the place of coal fires In all countries with cold winters ventilation cannot be attained by opening the windows, for the incoming cold air freezes the water in the "radiators"—as many a rash Englishman has discovered

British architects have rightly never favoured the Continental and American system of central heating, largely because it leaves the more difficult problem of ventilation completely unsolved But merely as a heating system it has several grave defects—it heats by convection, which is not economical, for it tends to cause the heated air to ascend first—that is, it leaves the floors comparatively cold it drives dust upward, and so discolours wallpapers and other objects, and it occupies floor space

The Roman system of heating by hypocaust gives us the principle to be adopted—namely, to heat the floors and walls, so that these large surfaces may become themselves sources of radiant heat Everyone knows that if our feet are warm our whole body is full of comfort, and if they are cold we are uncomfortable all over

As a matter of fact, some architects have already rediscovered the Roman method and have adapted it to certain present-day buildings Mr Gilbert Scott, the architect of the Liverpool Cathedral who took part in a recent discussion on heating at the Royal Institute of British Architects, said 'At Liverpool I am adopting the system of heating the floors by channels through which hot air circulates It has the great advantage of using marble or stone flooring without I hope, causing people to complain of a feeling of coldness in their feet It is a reversion to the Roman idea of heating" The heating of floors is being tried in schools erected by the education authority in Derbyshire Mr Widdows, the architect there, believes that the chief thing to aim at is to have the feet warm and to allow cool tonic air to have access to the upper parts of the bodies of the scholars Cold feet or any bodily discomfort make for inattention on the part of the children

To the engineers who are experts on heating systems must be left the decision as to the exact method by which the floors and walls shall be heated A room whose floors and walls are sufficently heated we can afford to ventilate with much greater freedom than with any "central" system In this—the true radiation method—we can endure around our heads air at a very much lower temperature than with a convection system, where, since the distribution of heat is by means of air currents, these may not be too lavishly carried off

Where floors and walls have to be heated architects prefer at the present day a system known as the 'panel," in which the heat is derived from water circulating in coils of jointless piping enclosed in the structure of the building The temperature of the water varies from 90° to 130° F, which is found to give at the floor just the right temperature for comfort The circulation in the coils is, of course under the control of the occupants of the room It has been calculated that the saving in fuel effected by this system as compared with the 'radiator" is as much as 20 per cent Of course, where there is access to a cheap source the electric current itself can be used instead of hot water to heat the floor No floor or wall space is occupied by the piping, which is all hidden, and there is no staining of the walls or ceilings by dust driven up by

the convection currents Further, the panel system does not interfere with any structural peculiarity in the building, nor with any of its characteristically decorative or æsthetic features

Australia House in the Strand and the operating theatres of King's College Hospital may be mentioned as heated by the panel system

D FRASER HARRIS

SOME MORE VOSGES SPAS

THE correspondent from whom we have already had two notes has supplied us with some further information about the spas which he has recently visited in the north-east of France It appears, for practical purposes, that they may be classified according either to the principal use to which their waters are put, or to the degree to which in their present state of development they are most likely to meet the needs of patients from the British Isles

At all the spas the waters are both given internally and administered in the shape of baths and douches, but at some the natural temperature of the water has resulted in their external use predominating This is the case at Luxeuil, Bains-les-Bains, and Plombieres, at all of which the waters are hot The first named of these three prides itself more particularly on the treatment of gynæcological disorders, considering itself entitled to do so because its waters can be, and are, utilized for prolonged vaginal irrigation without any previous exposure to the air and exactly as they issue from the rock Hence they retain all such remedial virtue as hot natural water containing various mineral constituents and of radio-active power, and issuing straight from the bowels of the earth, may be esteemed to possess Bains-les-Bains, the second of the group, claims to be particularly successful in the treatment of unduly high blood pressure and arterial diseases in general, while Plombieres, among several claims for its waters, includes more particularly a sedative effect on the nervous system

The other group consists of Contrexeville, Martigny, and Vittel, at which the waters are cold At all three of these the waters contain a certain amount of lithium and calcium sulphate, as well as other minerals, and cases of gravel, gout, sciatica, and arthritis probably predominate among their patients

All the six spas mentioned lie within about thirty miles of one another, at an elevation of from 1,200 to 1,400 feet, and all have hilly, picturesque, well watered and well wooded surroundings All, too, must overlie very porous subsoil, since rain, however heavy, leaves no trace after a very short time But they differ considerably in the matter of the environment in which the patients live, in the extent of their development and frequentation, and in the length of time for which they have been used In respect of relatively modern hydrology Contrexeville appears to be the oldest, since it was officially inaugurated as a health resort by the Government of the time in the year 1760 But Luxeuil runs it close in this respect, since it received similar recognition only some six years later In addition, it may possibly be the case that this spa is the oldest still in existence anywhere, for there is direct evidence that a bath house on the site of one of those now in use was repaired (not newly built) by order of Julius Caesar at a date shortly after his first subduction of the Gauls of this area As they stand at present, all the places from which these various spas derive their names contain, out of the season, not more than 1,000 or 1,500 inhabitants The exception is Luxeuil, which has an existence independent of its mineral water possessions, since, like Bath, it is a county town as well as a health resort

Plombieres, too, differs somewhat from the rest in respect of its precise situation This is half-way down a gorge so steep, deep, and narrow that the little town fills it from side to side, and might easily be overlooked altogether from a short distance It consists almost entirely of hotels and lodging houses, and recalls some of the older parts of residential Brighton

In respect of their therapeutic development, the arrangements at Martigny, Bains-les-Bains, and Luxeuil, though adequate, are comparatively simple in character Their places of amusement are also unassuming, but at all three there is good accommodation in the matter of hotels At Plombieres the general and specific arrangements are more elaborate, for there are three types of balneological establishments which cater for invalids of varying means

Vittel and Contrexeville are in a somewhat different class Both have earthy or calcareous waters, and at both the mineralization of the springs is low Both, but especially Contrexeville, have a considerable reputation for the treatment of affections of the urinary organs, including uric acid, gravel, and gouty oxaluria The medical arrangements at Vittel are good It has well designed and well managed facilities for modern spa treatment, and provides electro-therapy of all kinds, including light baths Its situation is beautiful, and since its origination some twenty five years ago the company owning the springs has developed it on double lines The principal hotels are built in palatial style and the amusements provided, including polo and racing, attract many fashionable visitors

Contrexeville, on the other hand, despite the fact that it lies only three or four miles away, has not allowed itself to be disturbed by the achievements in the latter respect of its youthful compeer Though it provides first-class hotels and a great many agreeable pastimes for its visitors, including golf, tennis, and theatrical performances, it has steadily adhered to its original purpose, and subordinates all its aims to those of effective treatment Its establishment was entirely rebuilt a year or two before the war, and in its present form it is as elaborately conceived and constructed a medical hydrological undertaking as can well be imagined Among other structural features it has a broad portico some 200 yards in length, up and down which patients saunter while drinking their allotted dose of water, in addition to rooms for the application of every sort of bath and douche that has ever been invented, there is a complete electro-therapeutic department in charge of an expert There is a well appointed clinical laboratory working in two departments the one is chiefly concerned with the analysis of urines, in the other blood examinations and the like are done for the doctors of the spa Indeed, Contrexeville as it now stands may be regarded as the present last word in the branch of therapy to which it belongs, and a pleasant, cheery resort even for the thoroughly healthy

All the spas mentioned report that they have completely recovered from the war, in respect of the number of their visitors These are cosmopolitan at the three more elaborately developed spas, but at the others visitors from the British Isles seem comparatively rare This is a circumstance which in the case of some invalids would be considered an added attraction They are all in varying degree very accessible—that is to say, they can all be reached within ten hours from Paris, while in the case of Vittel and Contrexeville the time occupied is less than six hours

The expenditure of a visitor varies naturally according to the character of the hotel chosen, but so long as the exchange rate of the franc remains anywhere near as low as at present, the expense of reaching a Vosges spa and remaining there for the usual period of three weeks must be relatively small A common kind of figure for board and lodging at good hotels appears to be 45 francs a day, and this at present works out at less than four guineas a week

In conclusion it may be noted that details in regard to the mineral contents of the springs of these various spas, and a great deal of practical information in regard to the treatment they provide, the pathological conditions which they are considered best able to combat, and their general arrangements, can be found in a book issued under the ægis of Professor Robin of the University of Paris, under the title of *The Spas of France* It is published in France at the price of 20 francs, and a new English edition will shortly, we understand, be obtainable gratis by duly qualified medical men, on application to the Office Français de Tourisme, 56, Haymarket, London, S W 1

Ireland

DOCTORS AND THE POOR LAW IN NORTHERN IRELAND

A MEETING of medical delegates of the Northern Parliamentary area of Ireland, arranged by Dr Morrison, M P (Blackhill, Coleraine co Derry), was held on September 10th in the Medical Institute, Belfast Dr John Campbell, M P (Belfast), presided On the motion of Dr Lyle (Newtownstewart), seconded by Dr Henry (Comber), a resolution was adopted to the effect that the administration of the Poor Law should be in the hands of the county, rural and urban councils, with local supervising committees and that as vacancies occurred, dispensaries should be rearranged and improved, modern diagnostic appliances being provided Another resolution, moved by Dr Mowbray (Castlederg) and seconded by Dr Osborne (Belfast), was carried to the effect that the minimum salary of a dispensary doctor should start at £300 per annum, and rise to £400, apart from other emoluments, such as vaccination, registration and public health offices that there should be an optional age limit of retirement with a sufficient retiring allowance and a 65 age limit with pensions on civil service scale and that county hospitals should be in the centre of the county with a surgeon with special knowledge in charge On the proposition of Dr Katherine Robertson (Limavady co Derry), seconded by Dr Mowbray, it was decided to recommend that workhouses should be abolished and the infirmary converted into a district hospital, a central workhouse being retained for the old and infirm in each county, children being boarded out, and a home provided for vagrants and unmarried mothers, for whom suitable work should be found Dr Burns (Belfast) moved, and Dr Jamison (Newtownards) seconded a proposal that salaries should be on a uniform scale and fixed by a joint committee of county and rural councillors and medical practitioners On the motion of Dr Fergus (Blackwater), seconded by Dr Duncan (Ballymena) it was agreed that the State contribution for grants-in aid fixed at the standard year of 1897 was wholly inadequate and should be equal to the amount raised by the local authority and that many matters, such as the prevention of disease, should be a national and not a local expense Dr Burns (Belfast) proposed, and Dr Henry (Comber) seconded, the appointment of a committee to act with the local Medico-Political Committee of the Ulster Medical Society and the Ulster Branch of the British Medical Association It was decided that a committee of twenty two from these bodies should collect evidence for submission to the Poor Law Commission

TUBERCULOSIS IN BELFAST

The chief tuberculosis officer of Belfast (Dr A Trimble) in his annual report shows a just pride in the fact that the death rate from pulmonary tuberculosis has fallen for five years in succession and now stands at 1 3 per 1,000, a reduction of 51 per cent as compared with 1918, and of 72 per cent as compared with 1890, when the rate was 4 7 per 1,000, a slight fall has occurred also in the rate due to the non pulmonary forms The Central Tuberculosis Institute was only opened in 1918 The number of examinations has increased by 227 this Dr Trimble considers was due in all probability to the trade depression, which compelled poorer patients to forsake their own doctors and avail themselves of the institute he modestly does not suggest that the increasing reputation of the institute may be a cause The usual charts and tables of statistics of the incidence, of occupations, of contacts, and the question of infection, of localities, pregnancies, of the work of the x ray and dental departments, of Graymount Hospital, and of the Insurance Committee, are instructive reading In a re survey of the old cases under domiciliary treatment the disease was found to be either quiescent or apparently cured in almost 50 per cent Unfortunately no census was taken in 1921, so that statistics based on population are mere estimates and it is well known that at the end of a decennium such estimates are often much out, there is however, the reassuring fact that the actual number of death from tuberculosis (571) in 1923 in Belfast was the lowest on record since 1880 when the population was only half what it is to-day There seems to be no doubt that pulmonary tuberculosis is steadily, and even rapidly, yielding in Belfast

Scotland.

COLONIAL SUPPORT FOR SCOTTISH HOSPITALS

A DONATION of £100 has been forwarded by the Selangor (Malay States) St Andrew's Society for distribution among deserving and necessitous Scottish hospitals and similar institutions Part of the sum is earmarked for St Dunstan's Home for Blinded Soldiers and for the National Institute for Scottish Blinded Soldiers and Sailors, while the distribution of the balance is left to the discretion of the editor of the *Scotsman* newspaper While the sums received by individual hospitals are small in amount, the fact that interest is maintained in home institutions by Scotsmen in distant parts of the world is one of great importance and worthy of imitation

EDUCATION OF VETERINARY STUDENTS

At the annual congress of the National Veterinary Medical Association of Great Britain and Ireland, of which we gave some account in our last issue, Principal O Charnock Bradley, of the Royal (Dick) Veterinary College, Edinburgh, dealt with the subject of veterinary education, and urged that in forming regulations for a course care should be taken that students were furnished with the broadest, soundest and most homogeneous preparation possible for their future duties Special lines of work ought to be left to post-graduate courses, and should not occupy undue time in a curriculum already sufficiently crowded Dealing with the proposal to extend the course to five years, he said that if it could be shown that the general veterinary practitioner might expect a reasonable return on the extra outlay, and if the number of students prepared to undergo this prolonged course of study would be sufficient to supply the country with an adequate number of veterinary advisers then the main objections to an extended curriculum would be met The essential for a perfect curriculum was to produce an educational fabric of even texture and lasting quality for the public use

India

THE LEE REPORT

AFTER three days' debate in the Indian Legislative Assembly at Simla the Government resolution embodying the adoption of the Lee Report was rejected by 68 votes to 46 Sir Alexander Muddiman, the Home Member, who moved this resolution on September 10th pointed out that of 3,000 appointments on the all India basis of the report, only 1 300 would be British filled including not only the military medical reserve but all other medical posts The recommendations of the report which related to medical reorganization had been deferred by the Government in view of their complexity and were therefore not involved directly in the discussion Lieut Colonel H A J Gidney, the nominee of the Anglo-Indian community, advocated the separation of the military from the civil medical service, both he and a succeeding speaker Sir Narasimha Sarma, maintained that the medical service however reorganized, would need for some time the strengthening and stimulation of a British element On September 16th the Government resolution approving the report was carried without a division in the Council of State

BOMBAY BACTERIOLOGICAL LABORATORY

A handbook has been prepared at the Bombay Bacteriological Laboratory for the use of those concerned with the campaign against plague in India the prophylaxis of rabies, or the diagnosis and treatment of disease by means of pathological research A detailed account, in simple language, is given of the various procedures adopted in dealing with plague, including a comprehensive description of the Haffkine vaccine, its mode of preparation, instructions for its use, and a report of the results already obtained Rabies and antirabic treatment are dealt with

very practically, and there is a diagrammatic scheme for distinguishing poisonous snakes The handbook is profusely illustrated and is of considerable general interest It gives an excellent idea of the valuable services that are being rendered by this laboratory since its establishment in 1896, through the efforts of Professor Haffkine, C I E

THE PREVENTION OF LEPROSY

Mr Oldrieve, secretary of the British Empire Leprosy Relief Association, who was for six years secretary for India of the Mission to Lepers, has written a book, *India's Lepers*,[1] to draw attention to the work of these societies, and to maintain that it is possible to extirpate leprosy from India The census of 1921 showed 102,523 lepers in India, in a population of 320 million But all with experience of Indian administration agree that this is an underestimate, the figures probably include advanced cases only Many lepers in early stages of the disease are unaware of its existence Many, especially women, are deliberately concealed The author reckons the number as about 250,000 Dr L Muir, whose experience is unequalled, estimated it at from half to one million At the last census Bengal, the United Provinces, and Bihar showed a decrease, Burma a considerable increase For these lepers there are 73 asylums, in nine provinces, with 7,311 inmates Native states contribute about 16 more asylums, with less than a thousand inmates Leprosy is a contagious disease, especially in its tubercular or nodular form, the anaesthetic form is little if at all contagious It is not hereditary, the children of lepers are born free from the disease, but are very liable to contagion Mr Oldrieve therefore advocates that all infants born in asylums should be removed from their parents and brought up in separate houses, the parents being allowed to visit them Experience shows that in such circumstances the children generally escape infection Many methods of treating leprosy have been tried, and most have effected improvement in some cases, nastin in particular gave hopes of success, but none have survived prolonged trial The method of treatment with salts of fatty acids, introduced by Sir Leonard Rogers, has given favourable results and holds out hopes of permanent success Mr Oldrieve advises that all wandering or begging lepers should be compulsorily segregated in farm colonies, the asylums being utilized for treatment of those coming voluntarily for treatment, which they now do in numbers beyond the present capacity of these institutions

INDIAN RED CROSS SOCIETY

A short notice was given in our columns of August 16th (p 294) of the third annual report of the Indian Red Cross Society A gratifying increase in the society's membership has occurred during the past year, the numbers rising from 428 to 2,107 As the result of the very successful Red Cross week held in Bombay in December, 1922, a special Red Cross lecturer was appointed to tour throughout the Presidency The results in increased membership and activity by the society were so considerable that the Bombay committee has notified the lecturer to continue to tour, and proposes now to accept the services of another lecturer, who has volunteered Several of the Indian States in the Bombay Presidency have recently started Red Cross branches On the closure of the Red Cross depot at Bombay at the end of 1922 the stores were transferred to Lahore, which is now the central supply depot of the society During the year requisitions have been received from all over India, and the railway authorities allow the society to dispatch Red Cross stores free of freight to all parts of India A large consignment of stores supplied from London by the British Red Cross Society enabled the Indian depot to help provincial branches very considerably Many military hospitals have been helped by the society during the twelve months The educational work of the society has made a great advance, twenty different pamphlets and leaflets have been published, dealing with the elements of health, the causes of the commoner diseases, and simple methods of treatment Twenty-one large posters have been prepared to illustrate some of the subjects Seven different sets of lantern slides for public health lecturers are also being prepared, and a considerable amount of miscellaneous material is available for educational purposes Over 250,000 pamphlets have been distributed in response to requests received, and the demand for lantern slides has been very great Consultation is taking place between the society and the Lady Chelmsford League for Maternity and Child Welfare, with a view to the organization of a concerted plan of action with regard to this educational literature

THE COUNTESS OF DUFFERIN'S FUND

The thirty-ninth annual report of the National Association for Supplying Medical Aid to Women in India has been issued During the year (1923) the governing bodies of the different funds for the physical welfare of women in India, of all of which the wife of the Viceroy is president, were co-ordinated under one administration The financial position of each of these different funds improved somewhat in 1923 The Women's Medical School at Agra was reorganized as a self-contained institution, staffed entirely by women The Women's Medical Service increased in numbers by four, one having resigned, and five new members having been appointed on probation It is now 41 strong, besides 13 in the junior medical service A list is given of the qualified medical women in India, of whom there are 369 An excellent map shows all the hospitals for women in India, the different grades of hospital being distinguished by different colours

AGRA MEDICAL CONFERENCE

The nineteenth All-India Medical Licentiates Conference will be held at Agra during the second week in December In conjunction with it an exhibition is being organized, it will comprise various exhibits and appliances relative to medicine, surgery, hygiene, maternity, and child welfare Certificates of merit with gold, silver, and bronze medals will be awarded for exhibits The first exhibition of this kind was held at Madras in 1916

Correspondence.

GALL STONES AND CANCER

SIR,—The British Medical Association Lecture of Dr Archibald Leitch on "Gall stones and cancer of the gall bladder" is of intense interest This is heightened by the deductions of the medical correspondent of the *Times* in the issue of September 13th, which are worth repeating He states

(*a*) This is the first time a carcinoma has ever been produced in a guinea-pig and that animal has never been known to develop any kind of carcinoma naturally

(*b*) It is the first demonstration that a mechanical irritant *can* produce a cancer

(*c*) It is the first time a cancer of the glandular type has ever been produced experimentally

(*d*) Above all it is the first demonstration that a pathological substance developed wholly within the living body—that is, a gall stone—can produce cancer by prolonged irritation or injury

A few remarks upon the paper and these deductions may not be amiss For the sake of clearness and reference I number them

1 Apparently the choice of the guinea-pig for these experiments was a peculiarly happy one

2 Forty guinea-pigs were used, 25 had one or more gall stones, 5 had smooth pebbles, 5 had pilules of pitch, and 5 had melted lanoline introduced into their gall bladders

3 Almost certainly, 8 out of the 40 guinea-pigs used developed a form of carcinoma—that is, a malignant neoplasm of an epithelial type This is 20 per cent, a very high percentage all will allow, and peculiarly high in guinea-pigs

4 Of the 8 which developed carcinoma, 5 had had one or more gall stones, 2 had had a pebble, and 1 had had a pilule of pitch introduced into the gall bladder before the onset of the growth of the neoplasm

5 This indicates that three quite different types of foreign bodies placed in the gall bladder of a guinea-pig can be *a* factor in the production of a carcinoma

[1] *India's Lepers How to rid India of Leprosy* By Frank Oldrieve London Edinburgh New York Marshall Brothers, Limited 1924 (8vo pp 144 2s 6d)

6 The gall stones are stated to have been four years outside a human gall bladder and were dry They were not sterilized before insertion It would have been interesting and instructive if half had been sterilized, if this had been possible, before introduction as a control If any remain of these gall stones which have not been used it would be helpful to have them even now examined bacteriologically Further, although the approximate size of the gall stones is mentioned, it is not stated whether they were smooth or more or less rough on the surface

7 The pebbles when introduced were presumably sterile, and they had a smooth surface

8 The pitch and lanoline were probably both sterile

9 The contents of the gall bladder, if any are not indicated in any of the cases in which carcinoma developed Was there any bile or mucus present

10 There is no record of any bacteriological examination of the interior of the gall bladder, either at the time of the insertion of the foreign body or at the time of the discovery of the carcinoma The presence or not of bacteria may have an important influence upon the incidence of a new growth

11 It is quite possible that a 'foreign" body like a gall stone may "irritate" so as to produce a malignant neoplasm, but it is probable that a foreign body *plus* the presence of some micro-organism, vegetable or animal, is more potent in such a production

12 Many of us have been teaching rightly or wrongly, that the formation of gall stones is largely dependent upon infection of the gall bladder, and that gall stones present in the gall bladder may be followed by carcinoma thereof

13 Hence the ultimate cause of the neoplasm in these cases may be stated to be infection

14 So that carcinoma, although itself not specifically due to a parasite, may need the action of a parasite introduced from without the tissue, together with some other irritation to cause its incidence

Thus we have the value of Dr Leitch's illuminating work and may consider the deductions in the *Times* fairly accurate and sound —I am, etc,

London W 1, Sept 14th W McADAM ECCLES

SIR —I am much obliged to you for showing me the courteous and interesting letter of Mr McAdam Eccles Using his numbers

6 The gall stones were not examined bacteriologically and the particular sample has not been preserved The stones were all smooth

7 The pebbles were sterilized, and served as controls

9 In most cases the cavity was obliterated In two there was a small amount of flaky fluid—probably cholesterin in suspension In microscopic sections there were deposits of degenerated mucus in some of the spaces, but the epithelial cells seldom took up the mucin stain

10 The bile was not examined bacteriologically As most of the animals were found dead such an examination would have been useless At any rate the tumour masses, liver, gall bladder, etc, were fixed in formalin before dissection

12 The observations of Chauffard, Rovsing, and Peyton Rous—to mention a few—are against the idea

11, 13, and 14 If a micro-organism played the part of a cancer producer it could only bring about its effects on the fixed tissue cells in one of two ways either by purely mechanical stimulation or by some toxic substance it produced In other words, it would be an irritant exactly on all fours with gall stones, tar, soot, paraffin oils, etc So why premise a second irritant, especially when we have no evidence of it —I am, etc,

London S W Sept 16th ARCHIBALD LEITCH

TREATMENT OF PUERPERAL SEPSIS

SIR,—We have read with considerable interest the letter written by the obstetric surgeons of Queen Charlotte's Hospital published in your issue of September 13th (p 488)

We quite agree that the method advocated by Dr Canney in his article on the treatment of puerperal sepsis (BRITISH MEDICAL JOURNAL, August 30th, p 356)—namely, the exploration and curettage of a septic uterus for retained products—is to be strongly condemned

We are of the opinion, however, that all cases, at the first sign of fever in the puerperium, should be subjected to a mild form of surgical treatment By a mild form of surgical treatment we mean intrauterine drainage and irrigation Daily visual examination of the cervix enables us to see whether there are any pieces of placenta or membranes presenting at the external os, which can be easily removed

Our experience shows that septic uteri, treated by drainage, involute rapidly and completely, whilst in those left alone involution is often slow with a tendency to chronic subinvolution They are also far less likely to be subject to recurrent attacks of pelvic peritonitis The methods of intrauterine drainage are fully described in the *Proceedings* of the Royal Society of Medicine, Section of Obstetrics and Gynaecology, vol 17 pp 73-85 *

In short, although we are strongly against exploring the uterus either with the finger or a curette at the first onset of fever in the puerperium, yet experience has shown us that it is better to employ intrauterine drainage immediately, rather than to adopt a 'wait and see" attitude —We are, etc,

REMINGTON HOBBS
ARTHUR D MORRIS
MICHAEL J O'BRIEN
MONTAGUE H RENALL
J A LUMSDEN COOK

St Mary Abbots Hospital Kensington S W 5, Sept 14th

SIR —It was with no surprise that I read the "round-robin" from most of the acting staff of Queen Charlotte's Hospital In what still remains a very controversial subject there are bound to be many who disagree with active exploration of the uterus This I knew

Treatment has ranged between what I take to be the two extremes—"the simplest medical methods" on the one hand and *sharp* curettage of the infected endometrium, followed by the application of strong antiseptics, on the other I have tried a middle course Being well aware of the danger of disseminating the infection by opening new areas, "I have always insisted that any active exploration of the uterus should be undertaken with the greatest care and with all possible gentleness" It seems that the chief bone of contention is my advocacy of the blunt flushing curette I can, however, assure the writers that the endometrium is "gently stroked," and, in fact, the curette is used more as an irrigator than anything else Since this paper was written I have on more than one occasion used a soft rubber tube instead

Of great interest and value are the statistics quoted—namely, subsidence of fever within four days in 89 2 per cent of cases of puerperal temperature" above 100° One may nevertheless assume that in quite a fair proportion of these patients the sepsis was not intrauterine, unless definite information to the contrary is forthcoming —I am, etc,

Cambridge Sept 15th J R CAMPBELL CANNEY

X-RAY INTERPRETATION

SIR,—The letter by Dr Hall-Edwards (BRITISH MEDICAL JOURNAL, September 13th, p 486), emphasizing the danger of the neglect of x-ray examination in cases of doubtful fracture, is a necessary and useful warning But in making the statement "a fracture of the neck of the femur can be diagnosed by means of the x rays with absolute certainty," it would have been better, I think, if he had added "by an experienced radiologist"

In 1918 I was medical officer in charge of electrical treatment at a command depot and sent one of my patients to the local military hospital for a skiagram of the hip-joint The skiagram was taken by a lady, who was a fairly capable radiographer but unfortunately she had a habit of writing reports also The skiagram was sent to the senior medical officer and thence to the comparatively medical officer concerned, and it was also casually seen by two other medical officers before it reached me, a report

* An abstract of the paper was given in our issue of the 4th published on April 14th 1923 (p 665)

later Not one of these medical officers questioned the accompanying report "No injury to bone," yet any radiologist could have seen at a glance that there was an impacted fracture of the neck of the femur This is only one of many similar experiences that I could mention It should be realized that where there is an x-ray department lacking the services of an experienced radiologist, a certain number of fractures will be missed—I believe 5 to 10 per cent

I would not on this account discourage the provision of x-ray departments in those hospitals so situated that the services of an expert are unobtainable, as the work of unqualified radiographers is on the whole more useful than harmful, but it should be realized that, with the exception of medical degrees and the great experience some nurses have had, the only useful qualification for work in an x-ray department is the membership of the Society of Radiographers, and that the possession of a title (which according to the lay press is a hall-mark of knowledge and skill in x-ray work), or the degree of M A , B A , B Sc , or any non-medical degree, does not imply that the possessor has any experience of radiography or medical radiology —I am, etc ,

WILFRID GARTON,
Radiologist, St Bartholomew's Hospital, Rochester

September 14th

LATENT JAUNDICE DURING TREATMENT WITH ARSENOBENZOL COMPOUNDS

SIR,—I have read with much interest Lieutenant-Commander Gerrard's article in the JOURNAL of August 9th (p 224) on the recognition of latent jaundice during treatment with arsenobenzol compounds He states that it was formerly the custom at Haslar to dissolve each 0 45 gram of novarsenobenzol in 4 c cm of distilled water, but that, owing to the frequency of jaundice, it is now the rule to dissolve each 0 45 gram in 10 c cm

During the past six years I have given each dose, irrespective of strength, dissolved in 2 c cm , which I inject into the ampoule containing the novarsenobenzol I have given some 4,600 injections in this manner and have never yet had a case of jaundice

My usual routine is to give eight injections for a course (two 0 45 gram, two 0 6 gram, and four 0 75 gram) at weekly intervals I would suggest that the cause of the frequency of jaundice at Haslar is, not the concentration of the solution, but the intensity of the course—every three days in primary syphilis and every four days in latent syphilis —I am, etc ,

A M STUART,
Surgeon in charge V D Clinic, Walsall Hospital

September 13th

CHRONIC ULCERATIVE COLITIS

SIR —In a letter last week, referring to the interesting leading article on chronic ulcerative colitis appearing in the BRITISH MEDICAL JOURNAL of August 30th, Dr Stacey Wilson made the suggestion that the mercury and iron perchloride mixture of Dr Wedgwood should be given a fair trial in the treatment of this intractable complaint Dr Wilson affirmed that he had had a good measure of success with this form of therapy From my own experience I feel that this old combination of drugs is worth reviving in the treatment of such colon infections as ulcerative colitis and chronic bacterial dysentery

Further, I believe that the severity of the illness in many cases of rheumatism in childhood can be reduced by the iron and mercury perchloride mixture In about twenty recent cases of this complaint in children I have found that measures directed towards the colon have been successful where salicylates have been disappointing Though I must admit that salicylates and treatment of the teeth and tonsils are sufficient for most cases, there remains a good percentage which will benefit from some form of treatment of the intestine, and high among the remedies I would place the iron and mercury mixture originally introduced by Dr Wedgwood —I am, etc ,

CHARLES J LEWIS, M D , M R C P ,
Acting Medical Registrar Westminster Hospital

London, W 2 Sept 14th

THE VALUE OF FRUIT AS A FOOD

SIR,—It may be agreed that Dr Habgood and others, who write so persuasively and forcibly on this subject, have sound scientific justification, but one often wishes that they would go into a little more detail in the matter, with due regard for financial, climatic, and other practical considerations Could Dr Habgood, for instance, set forth his idea of a complete diet table for a week in winter, suitable for a growing boy or a panel patient in a large town, indicating how, and to what extent, the usual porridge, meat, milk puddings, and so forth, are to be replaced, adequately and economically, by the "uncooked foods, fresh fruit, and green vegetables" so much, but so vaguely, talked about?

One does not wonder that many mothers, anxious to do the best for their families, but sometimes hard put to it to provide them with any sort of nutritious and palatable diet at all, ask for exact instructions on this subject If "an apple a day" is literal it must be supplemented, and if it is symbolic it must be interpreted, and advice which goes no further than "as far as possible" or "in increasing quantities" is hardly good enough, in view of the practical difficulties confronting an attempt to alter the dietetic habits of ordinary people —I am, etc ,

September 15th

THE HOURS OF MEDICAL WORK

SIR,—As a doctor who during a considerable part of his career went through the usual drudgery of general practitioner work, I wish to give a few words of advice to the younger members of the profession The older ones are hardened and mentally blinded, and will not change

First, be it observed that the working man works now forty-eight hours a week, and what is good enough for a "working" man should be good enough for an "educated" man If the doctor is on duty from 9 a m till 7 p m surely he has done enough for one day Let the *evening* consulting hour be from 6 to 7 p m , or, if that be not enough, from 5 to 7 p m The working man stops his work on Saturday, usually, at noon, is there any sense in a doctor consulting on a Saturday night, and making his life one ceaseless grind? Change, therefore, the evening hour on Saturday night to one on Saturday afternoon, say 2 to 3 o'clock, and have a few hours for recreation

The public have no mercy on their doctors, and I am sorry to say I have known many good, well meaning, but weak-kneed doctors die, in my opinion, fifteen to twenty years sooner than they ought, worn out mentally and physically, from the delusion that they could not be spared

It is most essential that the following notice be put up in the surgery

All messages for visits (except emergency calls) must be left here not later than 10 a m
Emergency calls only attended at any hour, day or night

When that rule is not attended to an extra fee on the visit must be charged Having practised these rules successfully I commend them to my younger professional brethren Only by having a few comparatively quiet hours daily is it possible for a doctor to study his profession and be in a position to "deliver the goods"—I am, etc ,

JOHN T MACLACHLAN

Harrogate, Aug 29th

THE ROLE OF THE GENERAL PRACTITIONER IN PREVENTIVE MEDICINE

SIR,—While the opening speeches upon this subject at the Bradford meeting (JOURNAL, August 9th, p 227 et seq) contain much admirable matter, the subsequent discussion inclined to degenerate into mere criticism of the whole time assistant medical officer

That local authorities should be in the habit of appointing recently qualified men and women to these posts is regrettable The situation seems to have arisen through the supply exceeding the demand, and it would be best met by practitioners taking a more lively interest in the appointments made in their districts and supporting the policy of the British Medical Association

After the war there was a glut of graduates, many of whom were unable to obtain junior hospital appointments

as a stepping stone to practice For want of something to do many of these young doctors took the Diploma in Public Health, assured by the teachers that it would be a useful "tag" to their names in any case Having obtained the diploma, it was only natural that they should have been tempted to accept the low-paid posts offered by local authorities in preference to the still lower paid assistantships offered by general practitioners, without, of course, any careful consideration of the merits of either The local authorities, on their part, were delighted to be able to get such cheap labour, which labour many of them fondly regard as satisfactory

A large number of laymen still think that one doctor is as good as another, except when such doctor is employed to deal with their own individual ailments It never enters the head of some lay committees that their medical officer must, if he is to do any good, enter into close co-operation with the general practitioner So long as they have obtained the services of a man with a registrable qualification they are satisfied The clinical officer (venereal disease, tuberculosis, or child welfare), as well as the medical officer of health, must have experience, administrative ability, and business capacity In addition he must have a good general knowledge of medicine if he professes a special subject These qualifications imply the expenditure of time and money, yet when men or women who have had perhaps a dozen years of general experience, and who have worked with this end in view, come to take up the career, they find themselves in competition with those who qualified but yesterday, and who are—unfortunately and foolishly—only too willing to sell their services at any price The appointing authorities do not seem to place enough value on mature experience, yet surely they realize that no practitioner in their district is likely to accept advice from a boy

To some extent it would appear that the school medical service has proved a red herring across the track of public health policy by diverting lay opinion into error Without wishing in any way to belittle the medical inspection of school children, one feels that this work, as carried on at present in many parts of the country could be done by quite junior medical men and women Much of it is simply routine, there is usually the guidance of a senior administrative officer (who may be the medical officer of health), and part-time specialists are freely employed for certain purposes A tuberculosis, venereal disease, or child welfare officer is, or should be, *ipso facto*, a specialist, and stands or falls on his specialized knowledge But lay committees seem unable to perceive the difference either in qualifications or salary, and gladly appoint young graduates to any of these responsibilities or even to a combination of the lot, provided they can be got cheap enough The fault lies in want of knowledge on the part of the public and medical practitioners can do much to remedy the defect

I cannot agree with the opinion expressed at the Bradford meeting that most clinical public health work can be done as well or better by general practitioners working part time Much of the work requires an independence which the practitioner cannot attain Nor is this work suitable for 'men wishing to ease off from the stress and strain of general medical practice" We want neither tired nor retired men in the public health service The sentiment betrays the acceptance of a common false doctrine—namely, that public health officials are people with a great deal of authority and very little to do In actual fact medical officers of health are very much the servants of the Legislature and of the local authorities, and spend worried, responsible lives, often thankless and too frequently poorly remunerated

It is odd that diametrically opposite opinions should have been expressed at two different points in the Bradford meeting with regard to part-time work The Section of Public Medicine and Industrial Diseases seems to have favoured general practitioners (presumably fully occupied) doing part-time public health work, whereas the report of the Public Health Committee of the Council (SUPPLEMENT, August 2nd, p 74) discountenanced whole-time public health officers doing part-time practice in the shape of consulting This sounds uncommonly like the behaviour of the dog in the manger While one agrees with the Public Health Committee in theory, it seems that local authorities must either find larger salaries or permit consulting work if there is to be a living let alone a future, for the public clinical officer Otherwise we shall all have to be content with the appointment of the inexperienced juniors who are the subject of criticism, and who will throw up the posts as soon as they realize their blind alley nature Local authorities can only find larger salaries by combining their areas (a policy which is anathema to most of them), or by obtaining larger Government grants, and, with the grants, more direct Government control

Some of the more immediate ways in which general practitioners can contribute to the success of preventive medicine were mentioned at the meeting I might stress the importance of timely, legible, and accurate notification of infectious disease, particularly tuberculosis But there is much that may be done by leading and educating public opinion and especially by supporting the general policy of the British Medical Association in the matter of public health appointment —I am, etc,

August 21st WHOLE TIME

WHOLE-TIME SPECIALIST CLINICAL OFFICERS

SIR,—In the discussion at Bradford on the role of the general practitioner in preventive medicine the heavy artillery of the public health service was well represented by senior medical officers of county councils and municipalities To one who has been engaged for many years as a specialist clinical officer the attitude of mind revealed by some of the speakers shows a lack of generosity and appreciation of the work of their staffs that fills me with dismay and indignation

Professor Harold Kerr, M O H Newcastle speaks of the multiplication of minor whole-time clinical appointments, and goes on to say that such specialist posts prove in most cases a mere cul de sac offering no prospect of professional or material advancement to the holder and if not soon relinquished it results only too often in a narrow and cramped outlook with blighting disappointment If this statement is sometimes true who is responsible?

The Public Health Acts created medical officers of health later statutes and orders brought the school medical officer, tuberculosis officer, venereal diseases officer, etc The study of tuberculosis or venereal diseases is the work of a lifetime, and many medical men carrying on this work have the complete confidence and esteem of the general practitioner Their work is of the highest importance to the profession and the community They ought to have the remuneration and prestige of specialist officers, and there should be no talk of their work being blind alleys It this work does not offer material advancement that is due to the neglect of the medical officer of health who usually advises his council to secure a man at the lowest salary possible and refuses him the recognition and advancement due to good and efficient service

Dr James P Kaye, M O H West Riding County Council, spoke of his thirty-eight whole-time assistants Why does he not call them colleagues, which they are? They act independently in clinical work, and have direct relations with general practitioners They are the school medical officers, tuberculosis officers, etc, in a very real sense I have an impression that a large administrative authority in Britain advertised recently for a chief clinical tuberculosis officer at £750 That is the remuneration offered a medical man acting as a consultant for the diagnosis and treatment of tuberculosis for a population of a million and a half

Let us have fair play all round We specialist clinical officers have never got it —I am, etc,

September 1st TUBERCULOSIS PHYSICIAN.

MEDICAL OFFICERS AND CONSULTING FEES

SIR,—On my return from the fourth conference of the International Union against Tuberculosis, I read with amazement the recommendation made by the Representative Body at Bradford regarding the acceptance of fees for consultations by so-called "whole-time" medical officers engaged in public health work

The "whole-time" officers concerned are the specialists, who are not medical officers of health, but whose status is that of salaried consultants—such as sanatorium medical officers, tuberculosis officers, school ophthalmologists, and V D officers The idea that these medical men should refuse consultations with general practitioners in cases of individuals who prefer to pay for services rendered is so illogical as to be amazing

Since my appointment to my present office in December, 1918, I have accepted fees for consultations with (or at the request of) private practitioners, made outside my office hours So far from bringing myself "into possible conflict with the general practitioners," I flatter myself that I have been of some little service to them, and believe that if the general practitioners in my district are consulted they will resent, as much as I do, any interference with my liberty of action in this respect

I would ask my fellow medical officers in public health employ not to be misled by specious arguments about the danger of an attempt to reduce salaries if fees are taken for consultations, and to remember that there is such a thing as selling one's birthright for a mess of pottage It is essential that appointments such as ours should not become "blind alleys," that a high professional standard be maintained, and that some room should be left for honest effort and skill to achieve due recognition If the recommendation of the Representative Body is accepted, can anybody doubt that the inevitable result will be to lower the standard to one of hopeless mediocrity, and to hand over these appointments to the journeymen of the profession?

The danger is a real one, and we should make every effort to have the unfortunate Bradford recommendation reversed before our position is seriously prejudiced —I am, etc,

September 12th TUBERCULOSIS OFFICER

*** The resolution as adopted was as follows "That the Representative Body is of opinion that it is not advisable that whole-time medical officers engaged in public health work should accept fees for private consultations"

POOR LAW PATIENTS AND FREE CHOICE OF DOCTOR

SIR,—I have no intention of entering into a controversy on the merits and demerits of this question, the Representative Body at Bradford having unanimously accepted the principle, and the practitioners—including district medical officers—in the Dartford Division having decided, if given the opportunity, to apply the principle in their area, in the belief that it is a progressive step towards placing Poor Law on the same footing as private and national insurance work

I write to assure "Nestor" that, during the discussions, no slur was cast upon, no attack was made on, the holders of Poor Law appointments There was a determination and hope to obtain better remuneration for Poor Law work, the records showing that in some cases the average has reached the low figure of 4d and 6d per attendance, including mileage and drugs Would it be unreasonable under such conditions for a practitioner engaged in Poor Law work, six miles from a patient, to be delighted to be relieved of the call by a practitioner living just across the way from such a patient, to say nothing of the patient's satisfaction at being allowed to call in this doctor—very likely the old family doctor—instead of sending six miles for the district medical officer?

No alteration from the existing system could be considered which ignored the indemnifying of the district medical officers regarding tenure of office and superannuation, but this ought not to present a serious problem, enormous sums must have accrued from superannuation contributions, as against the trifling amounts enjoyed as pensions by the few survivors There have been three deaths amongst Poor Law medical officers during the past three years in the Dartford Union, no Poor Law medical officer in this area has ever been known to enjoy a pension Free choice of doctor will make little disturbance in the less "populated" or rural districts, absolutely none in the unopposed practices

"Nestor" would be no "warrior" if he did not have a tilt at practices in "populated" areas having large panels Incidentally practices in such industrial areas have little else to depend on now, the population from birth to age 16 years and mothers being provided for over the heads of the general practitioner by ante-natal, child welfare, and maternity clinics, certified midwives, school, tuberculosis, and other clinics and hospitals, which have not yet cut so deeply into the purely rural practice When they do, let us hope the rural practitioner will be given the opportunity of carrying on the work in such clinics —I am, etc,

September 16th M W RENTON, Representative Dartford Division, British Medical Association

SIR,—I ask leave to endorse the letter of "Nestor" (September 13th, p 487) I hold a Poor Law appointment at £120 per annum, less deductions for pension In addition, I receive 12s for each successful vaccination I frequently cover forty miles in performing the vaccination and making the inspection Were I to lose this appointment my position would become untenable

"Nestor" gets to the root of the matter when he says that it should only be applied in densely populated districts I do not wish to imply that the fees are inadequate Indeed, they are fair I think there must be many others who, like myself, are enabled to exist on this money, but who, deprived of it, would starve —I am, etc,

September 15th S O.

THE MOTOR SHOW AT OLYMPIA

SIR,—It will be remembered that last winter the Medical Insurance Agency decided to add to the service which it already offered to members of the medical profession by providing them with expert assistance in everything appertaining to the purchase, use, and sale of motor cars, as well as expert guidance in the intricate matters relating to life and other assurances

With regard to motor cars I have received from the managing director of our consulting engineers the following letter relating to the forthcoming Motor Show

Olympia Exhibition

I have pleasure in advising you that our stand at the forthcoming exhibition (from October 17th to 25th inclusive) will be Stand No 202 in the Coachwork Section

As consulting engineers to the Medical Insurance Agency we have arranged for a number of representatives from our various departments to be at the service of all medical men calling at the exhibition with a view to advising them on any business, technical, or financial matters on which they require assistance Any communications addressed to us at our stand, or any appointments made to meet our representatives at any other stand, will receive immediate attention

Our special deferred payment terms for medical men (involving a 2½ per cent interest charge only) will, of course, be at the service of all your members

On our stand we shall have a very special type of bodywork suitable for doctors, which we think will be of great interest to them

Yours faithfully,
For Mann, Egerton and Co, Ltd,
G N C MANN
Managing Director

The advantage of an independent expert opinion when considering the purchase of a car is obvious, and it is hoped that every member of the Association attending the Motor Show of 1924 will take advantage of the service offered by the Medical Insurance Agency —I am, etc,

423, Strand London, W C 2, Sept 10th L FERRIS-SCOTT, Secretary Medical Insurance Agency

The Services.

ARMY MEDICAL SERVICE

In the article on the Army Medical Service published in the Educational Number of the JOURNAL (September 6th, p 443), the table of retired pay was correctly reproduced from the Royal Warrant as amended by A O 4 of January 31st, 1924, showing the maximum rates of retired pay It is there stated that in the case of a captain or subaltern it was £285 10s This statement in our columns was however immediately qualified by the further statement that voluntary retirement on retired pay is not allowed in the R A M C until after twenty years service Officers retiring before that receive the gratuities set out

Obituary

SIR FREDERICK NEEDHAM, M D St Andrews,

Commissioner in Lunacy and Member of the Board of Control

We had last week to announce with very great regret the death at Bournemouth on September 6th of Sir Frederick Needham, who had been medical superintendent of two important mental hospitals before, in 1892, he became a Commissioner in Lunacy He continued to hold that post and subsequently that of member of the Board of Control for twenty-seven years His professional life covered a period of rapid development in the study and treatment of mental disorders, and he had no small share in bringing about the numerous improvements that have been effected during the past three-quarters of a century in the conditions under which insane patients are housed and treated

Frederick Needham was born in York eighty eight years ago He was the son of Dr James P Needham, a physician in that city, and received his early education at St Peter's School, York He then entered St Bartholomew's Hospital, and took the diploma of M R C S in 1858, he became M P C P Edin in 1865 and L S A in 1866, he graduated M D St Andrews in 1862 In the year he qualified he was appointed medical superintendent of the York Hospital for the Insane (Bootham Park), and he was delighted to return to the city where he had passed his boyhood and where he had been educated in the shadow of the Minster he always maintained an abiding affection for his native county and its associations

Sir Frederick Needham.

When Needham received his first appointment an active campaign was still being conducted by the most enlightened of the physicians in mental disorders against the systematic use of mechanical restraint and other allied forms of treatment which, happily, in this country have long ago been discarded Of all these devices Needham was always a stern opponent even as respects forced alimentation by the nasal or oesophageal tube, salutary and life saving as he admitted them to be when properly and judiciously used, he urged that there were not a few cases in which rectal feeding was kinder safer and as efficacious In this connexion, and to anticipate for a moment his work as a Commissioner, it is of interest to know that it was he who, on behalf of the Board, drew up not only the regulations made under the section under the Lunacy Act dealing with mechanical restraint, but also the definition of 'seclusion'—the steady enforcement of both of which has left so deep a mark in the better treatment of the insane Much good work was done by Needham at Bootham Park, and when he left in August, 1874, to take up the post of superintendent or Barnwood House, Gloucester another well known hospital for the insane, it was in no uncertain terms that the committee of governors testified to the energy, zeal, ability, and success with which he had discharged very onerous duties during a period of sixteen years

By a somewhat curious coincidence it was for a nearly identical period that he was destined to preside at Barnwood This hospital already enjoyed a high reputation, but Needham, with his now matured experience and foresight, and with the support and good will of the committee, was able to effect various developments and adaptations, all of which materially added to the comfort of the patients and the efficiency of their treatment, and have stood the test of time When he left, the hospital occupied a still more honourable and important position

Dr Needham was offered and accepted the post of Commissioner in Lunacy in succession to Sir Clifford Allbutt, who relinquished the office upon being called to Cambridge as Regius Professor of Physic Needham filled the position, to which he was called in April, 1892, with conspicuous distinction until his retirement in June, 1919, it was naturally in this capacity that his influence was most widely felt Tall, dignified in appearance, and fearlessly outspoken he was by some held somewhat in awe, especially in his early days as a Commissioner, but whatever austerity of manner there may have been—and he could, indeed be stern when occasion demanded it—closely beneath was a kindliness of heart, a uniformly good temper, and a full measure of that spirit of helpfulness which has been said to give the profession of medicine its value to humanity Broad minded, tolerant of opposition and ready to consider and weigh the views of others, a most patient listener to conflicting claims, and endowed with a keen sense of justice, his judgement opinion, and advice were of immense value and weight to the Board of Control, and it is no wonder that when he decided to retire his colleagues, by each and all of whom he was revered, felt his loss to be irreparable He had a vitality, mental and physical, which enabled him, right up to his retirement and despite his advanced age, to do his full share of travelling and official visits

It is characteristic of his attitude towards his position he sought it can safely be said that over and above the inspectorial and advisory duties of the Board, he always considered that any question affecting personal liberty and the propriety of remaining under certificate was of paramount concern, and that it was of vital importance to maintain a close and individual touch between the Commissioners and the patients, to whom the officials should at all times either at visits or through the post lend a sympathetic ear His so often reiterated question—How will this affect the patients?"—might indeed be quoted as the motto of his life's work That a large section of the patients were conscious of the friend they had in Sir Frederick Needham is testified by their numerous inquiries addressed to his former colleagues as to his welfare

In disposition somewhat reserving, Sir Frederick was always accessible and helpful, and ever ready to take his share of the public work that came his way He was an active member of the Royal Commission on the Care and Control of the Feeble-minded (1904-8), and as indicative of the esteem in which his professional brethren have always held him, it may be mentioned that he was president of the York Medical Society, of the Gloucestershire Medical and Surgical Association, in 1887 of the Medico-Psychological Association of Great Britain and Ireland—whose members later conferred on him the rank of honorary member—and in 1890 of the Psychological Section of the British Medical Association, of which he was a member for forty-four years He contributed a number of thoughtful and valuable papers to medical literature, in which

connexion it may be recalled, as characteristic of his loyalty, that while in his 1890 presidential address he strenuously deprecated, among other matters, the function of a magistrate in the making of reception orders as being likely to delay and hamper treatment in early stages of mental illness, he was as a Commissioner inflexible in seeing that the provisions of the Lunacy Acts and, later, of the Mental Deficiency Act were duly carried out No servant of the public has better deserved the honour of knighthood, which was conferred upon him in 1915

While at York Needham married Charlotte, the daughter of the Rev J Shooter, vicar of Bishop Wilton in Yorkshire, whose wisdom and the influence of whose personality were of signal help to her husband in his work at Burnwood, when they left a graceful tribute to her voluntary assistance was paid by the governors of the hospital She died in 1907, and a stained glass window to her memory was placed in the chapel of the hospital In 1914 Sir Frederick Needham remarried, his second wife, by whom he is survived, being Helen, daughter of Mr W L Newman of York In the sorrow of her bereavement Lady Needham has the consolation of knowing that, as all her late husband's more intimate friends know, she brought great happiness and comfort to him in his latter years

The interment—at which, besides his widow, relatives, and friends, three of his old colleagues, representing the legal and medical sides of the Commission, were present—took place on September 9th in Bournemouth Cemetery, after the first part of the service had been held in St John's Church, Boscombe

SIR ANDREW J HORNE, F R C P I,

Dublin

We regret to record the death of Sir Andrew John Horne, F R C P I, on September 5th at his residence in Dublin, at the age of 68 He was the son of Mr Junius Horne of Ballinasloe, co Galway, and was educated at Clongowes College and in Dublin He took the diploma of L R C S I in 1877 In 1881 he became a Member and in 1885 a Fellow of the Royal College of Physicians of Ireland He was assistant master of the Rotunda Hospital from 1880 to 1883, and assistant secretary to the Vaccine Department of the Local Government Board from 1884 to 1900 From 1894 to 1896 he was Vice-President of the Royal College of Physicians, and was President from 1908 to 1910 On the foundation of the National Maternity Hospital, Holles Street, in 1894, he was elected master, a position which he held for thirty years Sir Andrew held several other important positions, being President of the Obstetrical Section of the Royal Academy of Medicine from 1902 to 1904, and again from 1911 to 1913 He was also Vice-President of the Obstetrical Section at the Annual Meeting of the British Medical Association at Swansea in 1903 He leaves two daughters and two sons, one of whom, Dr A J Horne, is assistant master of the National Maternity Hospital

Photo by [*Chancellor Dublin*

SIR ANDREW J HORNE

Sir Andrew Horne filled the various high positions which he occupied with the greatest distinction, and his death removes one of the most respected figures of the medical profession in Dublin He was possessed of a kind and generous nature, and in all movements of a philanthropic character took a prominent part His death will be deeply regretted by all who knew him, and the sympathy of a wide circle of friends will be extended to his family in their bereavement

The funeral took place from St Andrew's Church, Westland Row, for Glasnevin, on September 9th

WILLIAM BROMFIELD PATERSON, F R C S Eng, L D S Eng,

Late Senior Dental Surgeon, St Bartholomew's Hospital, London

It is with much regret that we announce the sudden death, on September 2nd, whilst on holiday at Buncrana, co Donegal, of Mr W B Paterson, at the age of 63 A month previously he had attended the seventeenth annual meeting of the International Dental Federation, held in the city of Luxemburg, and delivered a speech as the representative of Great Britain

He was educated at St Bartholomew's and the Royal Dental Hospitals, and took the diplomas of L D S Eng in 1883 and F R C S Eng in 1886 His ability as a student was recognized, and he was advised by his teachers to give up dentistry for general surgery He preferred, however, to keep to the specialty and became possessed of considerable experience and skill, as must fall to the lot of any man holding for many years appointments at both a general (St Bartholomew's) and a dental hospital (the Royal), and having in addition a large private practice His high position amongst his brethren may be shown by naming the offices he filled President of the British Dental Association and also of its representative board, president of the Odontological Section of the Royal Society of Medicine, dental surgeon and lecturer on dental surgery and pathology, Royal Dental Hospital, examiner for the L D S diploma of the Royal College of Surgeons of England and for the Dental Board of the United Kingdom He wrote numerous papers in the dental and medical journals, and re-edited the article on teeth in *Kirke's Handbook of Physiology* The profession loses a great personality and one of its most distinguished members There were few men better known, or more respected, in the dental world

We offer the widow and only child, a son in India, our sincere and deep sympathy in their bereavement

We are indebted to Mr W A Miggs, L R C P, M R C S, L D S, consulting dental surgeon to Guy's Hospital, for a tribute to Mr Paterson

Having enjoyed the close friendship of William Bromfield Paterson for about forty years, and deploring his early and sudden death, I feel constrained to add a tribute to his memory Mankind being divided into three groups—namely, "light givers," "light reflectors," and "light absorbers"—there would be no hesitation in placing Paterson in the first group His straightforward look and cheery smile betokened the man—honest and kind hearted "Patty," as he was familiarly called by his intimate friends, had a lovable character, and one could confide freely and safely in him, as was my happy experience He was educated at the City of London School—the school

of Sir Frederick Treve, Sir Frederick Hewit, and other eminent members of the medical profession—and he kept up to some extent his knowledge of the celebrities, and showed his interest in the school by attending the annual dinners. He was what is called "good company," being chatty, humorous, and possessed of a fund of anecdote, and having travelled through many lands his conversation was interesting and full of life, embracing many subjects outside dentistry and medicine. We served together upon several dental examination boards, and I found him a painstaking and conscientious examiner and a delightful colleague. He always laid stress upon the practical part of an examination, indeed, his usual question was, 'Is the candidate safe to be let loose upon the public?' His generous and thoughtful nature was evidenced to me by his numerous gifts in kind to needy friends, and I greatly admired this aspect of his character. As an example of his kindness it may be mentioned that he gave up for the whole period of the great war a consulting room in his house in Manchester Square for the exclusive use of a Belgian refugee dental surgeon. He was a man of simple habits, a non-smoker, and almost a total abstainer. His chief recreation was shooting, and he had looked forward to retiring from practice at no distant date and living in his dearly loved native county, Devonshire, and devoting himself to farming and sport. Alas! it had been ordained otherwise, but those who knew him will ever have a kindly thought for his memory. Farewell.

ALBERT HAWORTH, M.Sc., M.B., CH.B. MANCH.,

Assistant Lecturer on Chemical Pathology, Manchester.

It is with great regret that we record the death, on September 6th, of Dr. Albert Haworth at the early age of 30. His death was due to pneumonia succeeding septicæmia caused by a scratch received while carrying out a *post-mortem* examination at the Manchester Royal Infirmary.

Dr. Haworth had been associated with Manchester University for almost the whole of his interesting career as a student and graduate. He took the degree of B.Sc. in chemistry with first-class honours in 1910, and after graduating M.Sc. in 1911 entered the Medical School. His course was interrupted by a long period of service in France during the war, but he graduated M.B., Ch.B. in 1920. After some post-graduate experience at St. Thomas's Hospital, Dr. Haworth was appointed assistant lecturer in chemical pathology at his old school. During the few years he held this appointment he proved himself to be a most successful and efficient teacher, and exhibited great promise as a research worker. He had recently been appointed lecturer in chemical pathology at Leeds, and should have commenced his duties there at the beginning of the session. He was buried at Great Harwood on September 10th, and the large attendance of colleagues and students bore witness to his popularity and the great respect which was accorded to him.

It is a very serious matter, both to the cause of science and to the medical profession, to lose so sincere and earnest a worker. Dr. Haworth leaves a widow, who is also a member of the medical profession, and we tender our heartfelt sympathy to her and to his parents in their tragic loss.

THE LATE DR. T. SYDNEY SHORT

G. H. M. sends the following appreciation of Dr. Short, of whom we published an obituary notice last week (p. 490):

As one who knew Dr. T. Sydney Short for many years (we took the M.B. together in 1885 and I was resident medical officer at the old Birmingham General Hospital when he was resident at the suburban branch) perhaps you will allow me to emphasize a characteristic or two in his personality—and he had a very distinct mentality.

Thoroughness and un-paring pains in its practice were markedly his. He diligently attended the psychology lectures many of us much enjoyed that were recently given at the Birmingham University. Faced with a patient with a possible repression and obsessed with a fear of railway travelling he said at the end of his consultation something of this kind—"Now I shall be free after 4 o'clock, and at 5.15 we will meet at Snow Hill Station when you will go with me to Brierley Hill. I shall then see how a train and travelling in one really does affect you." He had some secret personal anxiety but the research was to be carried through. Or again a patient was recommended to Davos for a cure. He would tell him just when was the best time to start the most suitable place to stay at and that if he wrote early to so and so the manager he might perhaps secure such and such a room with just the most favourable aspect and so on. No detail too trivial that might be helpful or save the distressed patient anxiety. He had made the intimate knowledge of the resorts his holiday recreation.

When years ago his hospital nurses were taught massage, he himself attended and learnt the art practically and personally. He was indeed thorough and kindly painstaking for anyone worthy and in need.

The medical profession, and more particularly that part engaged in national health insurance work, is the poorer for the death, on September 10th, at the age of 55, of Dr. ROBERT J. FARMAN. In him the London Panel Committee has lost a most able and valued secretary, and its members individually an honoured and a trusty friend. Well equipped with a wide experience of general practice, Dr. Farman from the first took a great interest in the new conditions which arose on the introduction of the National Insurance Act. He served on the London Panel Committee from its inception and on the non-statutory committee which preceded it, and his opinions, which were always moderate and sound, were listened to with great respect. But it was probably as secretary to the London Panel Committee, to which post he succeeded on the resignation of Dr. Richmond in 1920, that he did his best work, and his value to the Committee, to the insurance practitioners of London, and, indeed, to the insurance service generally, can hardly be overrated. He was a master of all the intricate regulations which govern the service, and he was of the greatest help to all who came to him for advice and assistance. A man of considerable force of character, he was downright and outspoken in his opinions, and did not hesitate to express his views frankly, whether palatable or not, to his audience. He was for many years a representative of the London Panel Committee at the Annual Conference of Local Medical and Panel Committees and a member of the Distribution Committee and of the Allocation Subcommittee of the London Insurance Committee, on all of which he did valuable work. With those who had the privilege of his acquaintance he was popular, a staunch friend, and a charming companion. His death leaves a gap which it will be difficult to fill. He took the diploma of L.S.A. in 1894 (L.M.S.S.A. Lond., 1907), and practised at Swansea until 1910, when he settled in Kensington. The funeral, which took place at Golders Green Crematorium on September 15th, was attended by many friends and by representatives of the Panel Committee, the British Medical Association, the Insurance Committee for London, the Pharmaceutical Society, and other bodies.

Dr. WILLIAM NORMAN EVANS died suddenly of angina at his home in Hampstead on August 31st. He had spent the morning seeing patients and making the final arrangements for a fishing holiday, which he was to have commenced on the following day. He was 59 years of age and was the son of Herbert Norman Evans, M.B. Oxon., and succeeded his father in practice in Hampstead on his marriage in 1893. He was educated at Highgate School and St. Bartholomew's Hospital, and took the diplomas of M.R.C.S. Eng., L.R.C.P. Lond. in 1887. His family had been associated with medical practice in Hampstead for about 150 years, he being the sixth member in uninterrupted succession to practise there. He was for some years surgeon-captain of the 19th Middlesex R.V., and commanded the 5th London Volunteer Infantry Brigade Bearer Company. He was also medical officer of the Cripples' and Incurables' Home for Children at Hampstead. At the time of his death he was senior medical officer of the Hampstead Provident Dispensary. He married in 1893 Evelyn Walford, fourth daughter of the Rev. W. A. Cutting, vicar of Gayton, near King's Lynn, Norfolk, and leaves a widow and two married daughters. A man of great kindliness and charm of manner, he was much beloved by his patients and friends.

DR FRITIOI NORMAN MCFARLANE, who died at King's College Hospital, London, on August 17th, was the son of the late DR SEWELL MCFARLANE, who for some years was superintendent of the London Mission Hospital, Tientsin, North China, and was later in charge of the London Medical Mission in Endell Street. DR NORMAN MCFARLANE, who was born in China in 1896, was brought to England at an early age, and was educated at Croydon, and later at Edinburgh University. He left the medical school in the first year of the war, and served as a lieutenant in the Royal Field Artillery, he rendered distinguished service in Mesopotamia and other Eastern fields of the war. In 1919 he resumed his medical studies at Edinburgh, and graduated M.B., Ch.B. in 1922. He then went to the Radcliffe Infirmary, Oxford, where he held in succession the posts of resident accoucheur, casualty house-surgeon, and house-physician. He was very popular as a student in Edinburgh, and again at Oxford he was respected and admired by those for whom and with whom he worked. A most upright gentleman, a sincere friend, altogether a man of the highest ideals and full of promise in his profession, his country, and Oxford in particular, loses most sadly by his early death.

DR WILLIAM AUGUSTUS MAYBURY, who died last month at his residence in Colchester, aged 77, was the son of the late DR W. G. MAYBURY of Frimley, Surrey. He was educated at St. Thomas's Hospital, London. In 1870 he obtained the diploma of M.R.C.S., and in 1871 that of L.S.A., in this latter year he graduated M.D.R.U.I. After holding resident appointments in St. Thomas's Hospital and Newark Hospital he started practice in Colchester, where he held the appointment of medical officer to the Colchester Union from 1876 until his resignation ten days before his death. He was the borough police surgeon for over forty years, and churchwarden of St. Martin's Church for nearly fifty years. Two of his brothers who died previously were in the medical profession, and two surviving brothers are also medical practitioners.

DR RICHARD THOMAS JONES, who died on August 1st at Harlech, was born in 1854 and educated at Owen's College, Manchester, and Guy's Hospital, London. In 1879 he received the diplomas L.R.F.P.S.Glasg. and L.S.A.Lond. From 1879 to 1924 he practised in Harlech and was the medical officer and public vaccinator of the Festiniog Union, medical referee to various insurance companies, lecturer and examiner of the St. John Ambulance Association, and medical officer to the Post Office and the infant welfare clinic. He had been chairman of the South Carnarvon and Merioneth Division of the British Medical Association. For thirty-five years he was a justice of the peace for Merionethshire and chairman of the local bench. He was the first county councillor for Harlech, and took great interest in agriculture. He was latterly in partnership with his youngest son.

DR VERNON FRANCIS ALLEN died on August 30th in a nursing home in Swaffham, Norfolk, at the age of 58. He was educated at Queen's College, Cork, and Edinburgh University, and in 1891 received the diplomas of L.R.C.P., L.R.C.S.Edin., and L.R.F.P.S.Glasg. He was surgeon to the Swaffham Cottage Hospital and medical officer and public vaccinator for the district. He was a member of the urban council from 1898 to 1910, and a prominent member of the Swaffham and other coursing clubs. He was injured in a motor accident a few months ago and had since been unable to continue his practice. He leaves a widow, a daughter, and a son.

DR HENRY CRAIG WALLACE was killed on September 6th in a collision between his motor bicycle and a motor van at Rawdon, near Bradford. He was educated at Glasgow, where he graduated as M.B., Ch.B. in October, 1923. He was in practice at Rawdon, acting as assistant to DR H. B. SPROAT, and was a member of the British Medical Association.

The well known surgeon, PROFESSOR EDOARDO BASSINI of Padua died recently, at the age of 80.

Medical News.

ON September 13th the Duke of Connaught opened the new open air ward of the War Memorial Children's Hospital at Swanage. This hospital was founded in 1919 by the Dorset Red Cross Society for children under 12 years, the children of Dorset ex-service men receiving priority. The new ward, which cost about £1,000, accommodates children with surgical tuberculosis. The Duke of Connaught, in his speech, referred to the gratifying fact that the hospital was entirely free from debt, and paid special tribute to the voluntary work of the medical staff and to the help given in the education of the children in hospital by the members of the county Voluntary Aid Detachment.

THE prizes at St. George's Hospital Medical School will be distributed on Wednesday, October 1st, at 3 p.m., by SIR ISAMBARD OWEN, M.D., who will also preside at the annual school dinner at the Hotel Metropole on the same evening.

A THREE months' course of lectures and demonstrations in hospital administration, complying with the revised regulations of the General Medical Council, will be given at the North Western Hospital by DR E. W. GOODALL, Medical Superintendent, beginning on Thursday, October 2nd. Full particulars can be obtained from the Clerk to the Metropolitan Asylums Board, Victoria Embankment, E.C.4.

A COURSE in mental diseases for secretaries of associations for mental welfare and other experienced social workers will be given at the Maudsley Hospital by the Medical Superintendent, DR EDWARD MAPOTHER, beginning on October 27th. The course has been arranged by the Central Association for Mental Welfare. Full particulars can be obtained from its honorary secretary, Miss Evelyn Fox, at 24, Buckingham Palace Road, London, S.W.1.

A COURSE of lectures on infant care, for health visitors and others interested in like work, has been arranged by the National Association for the Prevention of Infant Mortality. The lecturers are DR ERIC PRITCHARD and DR H. C. CAMERON. The lectures will be given on Mondays from 6 to 7 p.m., beginning on September 29th. The same association has arranged a course of elementary lectures for creche nurses and probationers by DR LINA POTTER, the first will be given on October 2nd. Both courses will be given at Carnegie House, 117, Piccadilly, London, W.1, full particulars can be obtained from the association mentioned at this address.

AN intensive course in general medicine and surgery, and in the various special departments at the Westminster Hospital, begins on Monday, September 22nd, at 10.30 a.m. The second week, advertised to begin on the 22nd inst., of the special course in infants' diseases, is no longer open for new entries, as the Infants Hospital has already received the full number of entrants. The third week of the course in the Royal Westminster Ophthalmic Hospital, commencing on September 22nd, includes every afternoon at 2 o'clock, and special demonstrations three times a week. A course of lecture demonstrations in psychological medicine begins at the Bethlem Royal Hospital on September 30th, they will be given at 11 a.m. each Tuesday and Saturday. Full particulars and syllabuses of these courses may be obtained from the secretary of the Fellowship of Medicine, 1, Wimpole Street, W.1.

THE second dinner of the Queen's University (Belfast) Club, London, will be held in the Hotel Belgravia, Grosvenor Gardens, S.W. (opposite Victoria Station), on Thursday, October 9th, at 8 p.m. It will be open to members and to Queen's students and graduates desirous of becoming members. The charge for the dinner will be collected on the occasion. Those intending to be present are requested to notify, not later than October 6th, the honorary secretaries at 17, Wimpole Street, W.1. The annual meeting will be held before the dinner (7.15).

A CONFERENCE on how to reduce the maternal mortality rate by the co-operation of all the health services concerned will be held at the Royal Society of Arts, Adelphi, on October 6th. The chair will be taken by DR. LAMBAIRN at 5.30 p.m. Among the speakers will be MR. ALECK W. BOURNE, F.R.C.S., who will deal with ante-natal care, DR. J. W. WAYTE, whose subject will be the general practitioner and the midwife, DR. E. F. PALGRAVE, who will speak on the local supervising authority, and MR. E. W. G. MASTERMAN, F.R.C.S., who will discuss the provision for expectant and lying-in mothers under the Poor Law. MRS. BRUCE RICHMOND and MISS LIDDIARD will also take part in the discussion.

THE Society of Public Analysts will hold its first meeting for the session in the rooms of the Chemical Society, Burlington House, on Wednesday, October 1st, at 8 p.m.

THE jubilee of the Yorkshire College and the coming of age of its successor, the University of Leeds, is to be celebrated during December It is expected that delegates of other universities and of learned societies will attend and will present congratulatory addresses on Tuesday, December 16th

THE Sir Malcolm Morris Memorial Fund now amounts to £476 Among recent subscribers are Professor Winifred Cullis, D Sc , the Girls Boarding School Company, the National Association for the Prevention of Tuberculosis Sir Herbert Thompson, Mrs Catherine Thursby, and Dr Bertram Watson Further subscriptions may be sent to the Honorary Treasurers, "Sir Malcolm Morris Memorial Fund, ' 12, Stratford Place, London, W 1

IT is stated by the *Liverpool Daily Post* that a movement has been started in Liverpool to establish a hospital for diseases of the heart

AN inquest on the body of a child named Nellie Burnham, aged 10 who died on August 10th, was concluded on September 12th at Gloucester Dr W R Hadwen, who attended the child between August 1st and 9th, stated in the course of his evidence that there was no clinical symptom or sign of diphtheria in the deceased from first to last Dr E S Ellis who was called in on August 9th, diagnosed the case as one of diphtheria and pneumonia Dr W Washbourn, who made a *post mortem* examination in the presence of Dr J A Bell (Deputy Coroner) on August 12th, described the pathological findings and expressed the opinion that death was due to diphtheria and pneumonia The jury, after a retirement of three quarters of an hour, handed in a written verdict, which the foreman said was the verdict of nine of the twelve jurymen, that "the child died from diphtheria and pneumonia and that Dr Hadwen failed to show competent skill and special attention, in consequence of which failure the child died" The City Coroner (Mr G T Wellington) said that this in law was a verdict of manslaughter and committed Dr Hadwen to take his trial at the next assizes, bail was allowed On September 13th Dr Hadwen was charged before the Gloucester City Bench of magistrates (of which he is a member) with manslaughter The proceedings were formal and on the application of the police he was remanded until September 19th, bail being allowed

A SUM of 55 000 francs has been received by the Brussels University Library from the Professor Léon Stienon Commemoration Fund The income will be devoted to the purchase of the principal medical periodicals

ON September 1st a monument was unveiled at Charlton, Massachusetts, in memory of Dr W T G Morton who, on October 16th, 1846 first publicly administered ether for a surgical operation at the Massachusetts General Hospital

THE fourth international congress for combating the use of tobacco was held at Graz in July, when papers were read on damage to women s health by smoking (by Dr P Hofstätter of Vienna), on women and the vice of smoking (by Professor M Hartmann of Leipzig), and on tobacco and weakness of will (by Professor Hamburger of Graz) Professor Polland and Dr Peuter of Graz, who read papers on syphilis and smoking and damage to the heart and vessels by tobacco, stated that the bad effects of tobacco were much greater than was supposed especially as it was often associated with alcoholism and syphilis

MESSRS H K LEWIS announce for early publication a *Synopsis of Special Subjects Dermatology* by Dr H Semon *Obstetrics and Gynaecology*, by Mr M Donaldson, F I C S *Ear Nose and Throat*, by Mr A Pyland, F P C S , and *Eye*, by Mr J F Cunningham F P C S

THE twenty fourth congress of the French Association of Urology will be held in Paris at the Faculty of Medicine on October 8th, and the next congress of the Society of Orthopaedics on October 10th in the same place

THE August number of *La Chirurgia degli Organi di Movimento* contains a sympathetic memoir by Professor V Putti of Bologna of Dr P W Lovett Professor of Orthopaedic Surgery at Harvard, who died at Liverpool on July 2nd, and of whom we published a biography in our issue of July 12th Professor Putti appends to his memoir a bibliography of Professor Lovett s principal works

MESSRS WILLIAM HEINEMANN (Medical Books), Ltd , will shortly publish a volume on *Ultra violet Rays in the Treatment and Cure of Disease* by Mr Percy Hall, M R C S , L R C P with introductions by Sir Henry Gauvain, M D , and Dr Leonard E Hill, F R S

THE late Mr Albert George Keen of Edgbaston left £2 000 to the Birmingham and Midland Free Hospital for Sick Children, £1 000 to the Convalescent Hospital for Children, Moseley Hall, and £1,000 to the Convalescent Home for Children, Bromsgrove

JAPAN, which had no medical women thirty years ago has now more than 1,200 qualified women The Tokyo Medical College for girls, which was established in 1889, admits about 130 students annually.

Letters, Notes, and Answers.

ORIGINAL ARTICLES and LETTERS *forwarded for publication are understood to be offered to the* BRITISH MEDICAL JOURNAL *alone unless the contrary be stated* Authors desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Financial Secretary and Business Manager 429 Strand W C 2 on receipt of proof

Communications intended for the current issue should be posted so as to arrive by the first post on Monday, or at latest be received not later than Tuesday morning

ALL communications with reference to advertisements as well as orders for copies of the JOURNAL should be addressed to the Financial Secretary and Business Manager 429 Strand London, W C 2. Attention to this request will avoid delay Communications with reference to editorial business should be addressed to the Editor BRITISH MEDICAL JOURNAL 429 Strand W C 2

CORRESPONDENTS who wish notice to be taken of their communications *should authenticate them with their names*—not necessarily for publication

THE telephone number of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is Gerrard 2930 (Internal Exchange) The telegraphic addresses are

EDITOR of the BRITISH MEDICAL JOURNAL, *Attolico, Westrand, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc) *Articulate Westrand London*

MEDICAL SECRETARY *Mictucra Westrand London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street Dublin (telegrams *Bacillus Dublin* telephone 737 Dublin) and of the Scottish Office 6 Putland Square Edinburgh (telegrams *Associate, Edinburgh* telephone 371 Central)

QUERIES AND ANSWERS.

"K" asks for advice in the treatment of an obstinate case of lupus erythematosus in a married woman aged 30 with two children She menstruates about once every three months but her general health is otherwise good except that she is slightly neurasthenic K has tried calcium lactate sodium hypophosphite applications, and the measures usually advocated

EXTRAGENITAL SYPHILIS

"B K"—(1) Theoretically it may be considered possible that the disease might be transmitted by a patient with syphilis of the throat coughing into the face of another but it is unlikely Patients sometimes imagine they have been infected in this manner but there is no demonstrable evidence that syphilis can be spread by coughing (2) It is again theoretically possible that a needle which had pierced a patient through a syphilitic secondary papule and had immediately been used another person could carry infection So far as we can ascertain there is no evidence that this has ever occurred and the eventuality need not be considered as a practical question (3) It is true that any small abrasion of the skin even though unsuspected may furnish a surface for inoculation but the reported cases among medical men have all been examples of infection of a cut or puncture

BATTERY FOR IONIZATION

DR. W BLACK JONES (Builth Wells) writes In reply to Anxious" the General Electric Company Ltd supply a Leclanche cell which has given me satisfaction for some years I recommend the Carsak pattern quart size The zinc element is a semicircular plate but I prefer to replace it by two zinc rods the advantage is that if one terminal is corroded the other rod keeps the cell going they are also easier to remove Sal ammoniac pellets should be used after the battery has been charged it is only necessary to add about six, two or three times a year

INCOME TAX

Succession to Partnership

"W B" has recently succeeded to the whole practice and his liability for the first subsequent year is being assessed on the basis of the income of that year in place of the three years average. The inspector claims that the income should be calculated on the basis of gross bookings less 5 per cent

*** 'W B' does not say whether the amount of cash receipts he mentions includes those resulting from his former partner's share of the practice Probably it does not, if however it does include those receipts we consider that he can reasonably claim to have his liability assessed on the (gross) amount or alternatively to rely on the figures as showing that the 5 per cent for bad debts is altogether insufficient adducing as proof the wide divergence between the bookings and receipts of the year in question I must be admitted however as for such a purpose as the displacement of the three years average of exceptional on the gross bookings less allowance for bad debts give the correct basis, but 5 per cent may be inadequate for the allowance on this point W B can no doubt produce some evidence from the records of bookings and receipts for previous years

Retiring Partner

"LEEDS" is selling his share in a practice, but will continue to receive his share of the book debts earned before but paid after leaving the practice How is the income tax to be arranged for the coming three years?

*** As from the date of leaving the practice "Leeds" will not be liable to assessment in respect of that source of income—for example, if the date is October 5th his share of the firm's gross assessment to April 5th, 1925, will be only one half of what it would otherwise have been, the incoming partner, on the other hand, will have to shoulder liability on the other portion—that is, on the one half share for the six months to April 5th, 1925 The difficulty anticipated really comes into operation for 1925-26 and future years, because for the purpose of the assessments for those years it is necessary to calculate the firm's profits for the year 1924—that is the year in which the change in the partnership takes place The new firm will have the choice of two alternatives either it can calculate its profits by reference to the value of gross *bookings*, or it may adhere to the cash basis, but in the latter case it must bring in all receipts whether handed on to "Leeds," paid to him direct, or received and retained by the new firm If "Leeds's" receipts are not included, the final average result will represent something less than the full earnings of the practice, and the partners' liability, it should be remembered, is their respective shares of the assessment on the earnings *of the practice*

"A T T's" partner left the firm at the end of 1923 and "A T T" succeeded to the whole practice The inspector of taxes agrees to deal with his liability on the earnings for the year, but says that the return for assessment should be made on the usual three years' average

*** This is correct The point is that though "A T T," the successor to the former firm, is assessable on the three years' average notwithstanding the change in proprietorship, he can apply at the end of the year of assessment to have the assessment reduced to the amount of the profits of the year, provided he can show that the profits have fallen short from some specific cause since or by reason of the change It should be remembered that the minimum liability is the year's profits *of the practice*, whether realized in cash or not, this amount is, strictly, the value of the gross bookings less expenses, but it is possible that the inspector may be prepared to accept the cash payments in the twelve months in respect of practice debts in substitution for bookings

Whole time Officer

'J B McC," a resident medical officer (Poor Law), inquires as to the basis of the return to be made for 1924-25 The answers to the specific questions put are as follows

*** (1) The return should be made on the amount expected for the year to April 5th, 1925, the war bonus may affect the total amount, and, if favourably, the revenue authorities will presumably raise the assessment, if adversely, "J B McC" should apply in April for a reduction of the assessment to be effected as against the second instalment of tax due in July (2) An allowance is due for the superannuation deduction (3) The actual out of pocket cost of necessary locomotion can be claimed, but not the original (that is, capital) cost of the cycle or other means of locomotion (4) The same applies to books and instruments, assuming that the necessary equipment is not provided by the employing authority No other allowances occur to us as due, apart, of course, from the usual personal allowances

LETTERS NOTES, ETC.

DERMATITIS DUE TO CATERPILLARS

SURGEON COMMANDER FREDERICK COCK, R N, writes In the communication on dermatitis caused by hairy caterpillars, by Dr Charles B Rossiter (August 23rd), he states from his own experience as follows—"In a few days the hairs are gradually cast off from the skin and irritation then stops Until I made this observation I had imagined (like others) that the irritation was caused by some chemical emanation" This observation does not exclude the possibility of there being a chemical poison on the hairs of the caterpillars Children are often seen to handle hairy caterpillars without harm, but sometimes irritation of the skin follows This seems to be fully accounted for in Fabre's *Life of the Caterpillar* Briefly, the virus (common to all Lepidoptera) is a waste product which is expelled in the caterpillars' droppings, and from which the author obtained an extract the energy of which rivalled that of cantharides, if not exceeding it It is only those caterpillars that dwell in nests and have their hairs smeared by the droppings that, on handling, cause skin irritation, those that live in isolation are not contaminated by the excretions, and are harmless As regards relieving skin irritation, the juice of any tender foliage is recommended, also parsley and purslane, the latter giving relief almost immediately The fact of the virus having been extracted from the droppings by means of a solvent, and the nature of the remedies employed, seems to leave no doubt as to the nature of the irritant The above notes are taken from the chapter "The Pine Processionary The Stinging Power" in the above named book

MATERNAL MORBIDITY

DR HELEN BOYLE (Brighton) writes to point out some of the inaccuracies in the report of her remarks on maternal Women's International Association last July The suggestion with regard to the notification of symptoms in early cases of disease occurring during the puerperium should have been ascribed to Dame Janet Dr Boyle, and her statement with regard to should have been that she had rarely seen this condition in a woman who was nursing her child at the time The cases quoted by her of filtre four women who, though febrile during the puerperium, had been allowed to suckle their children was quoted from our columns, it was not quite correct to say that the children did perfectly well, though in every case but one a transitory loss of weight was the only adverse occurrence

DR SYLVIA G CHAPMAN (New Zealand) writes to correct an error in the account of her speech on maternal morbidity at the meeting of the Medical Women's International Association which was reported in our columns of August 2nd (p 201) She did not say that private maternity hospitals in New Zealand were supported by the State This is not the case

A JENNER RELIC

WE have received from Messrs Anderson and Virgo, an old established firm of chemists in Worcester, an interesting and well executed set of photographs relating to the question of the horns of Jenner's first cow, as to which there has evidently been some confusion In the pathological department of St George's Hospital there is a cowhide inscribed "The skin of the cow from which the first vaccine matter was taken by Dr Jenner Presented by his son, 1857" This cowhide has horns, but it turns out that they are of wood, and it appears that the original horns were absent when the hide was received at the hospital At the Royal College of Physicians there is a single horn, bearing on a silver plate the inscription "The horn of a cow given by the benefactor of man, Dr Jenner to his friend Sir John Fisher, and presented to this institution in 1813" But the inscription does not state that this horn was from the first cow from *which* Jenner obtained vaccine And now Mr G A Turner, *the principal* of Messrs Anderson and Virgo, has purchased and mounted on a mahogany shield a pair of horns, one of which bears a scr pt, not quite entire, but sufficient for the purpose, stating that these are the horns of the cow from which the matter was first taken by Dr Jenner The inscription is signed with what seems unquestionably the signature of Stephen Jenner, son of Henry Jenner who was a nephew of, and medical apprentice to Dr Edward Jenner In connexion with the photograph good evidence is submitted that the signature is that of Stephen Jenner, that he disposed of the horns to a furniture dealer is borne witness to by the dealer's son

HERPES AND VARICELLA

DR D REES ROBERTS (New Tredegar, Mon) sends the following note illustrating the apparent relation between herpes and varicella On August 16th last a boy, aged 4½ years, came home after a holiday of ten days with well marked herpes zoster on the right side On August 30th his sister, aged 11 months, developed well marked varicella The mother of these two children developed facial herpes on August 30th, her age was 33

WAR YEAR COPIES OF THE "BRITISH MEDICAL JOURNAL"

MR B M HLADICAR, honorary secretary of the Universities' Library for Central Europe (London School of Economics, Houghton Street, Aldwych, London, W C 2), writes From time to time, through the kindness of some of your readers, we are able to send used copies of your valuable JOURNAL to various universities and scientific societies in Central Europe We have just received a note from the Leipzig University Library deploring that they are seldom able to secure issues published during the war years If any of your readers have such copies which they would care to present to the institution in question I shall be glad to receive them for dispatch to Leipzig

POOR LAW PATIENTS AND FREE CHOICE OF DOCTOR

IN our issue of August 30th (p 392) we published a resolution on this subject which, we were informed, had been adopted by the Chesterfield Rural District Council The clerk to that council writes to state that the resolution was passed, not by the rural district council, but by the Chesterfield Board of Guardians

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 30, 31, 34 35, and 36 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 32 and 33

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *120*

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

199 On the Use of Immune Serums

H B CUSHING (*Canadian Med Asso Journ*, June 1924 p 477) observes that the "spectacular success of Behring's discovery (1894) of diphtheria antitoxin led to the hope of overcoming all infections by immune serums We now realize the limitations of this method of treatment and are gradually overcoming its difficulties Estimation of the value of treatment in these cases is always uncertain, since all acute infections are self limited, and other points have to be considered—*for example* the beneficial effects of any foreign protein reaction Thirty years experience has brought to light certain underlying principles and limitations (1) The need of a very large dosage to obtain results The 5 000 unit dose of diphtheria antitoxin required in an average case in a child is actually enough to neutralize an amount of toxin which could kill a hundred children but the high dose is required owing apparently, to the difficulty of bringing toxin and antitoxin together in the body For prophylaxis much smaller doses—*for example* 500 units—suffice (2) Concentrated serums should be used (3) Antitoxins require time to produce their full effect In diphtheria the maximum concentration of antitoxin does not occur for three days when it has been given subcutaneously and when given intramuscularly two days, repeated small doses are therefore contraindicated The intraperitoneal method is safe and easy, but the most efficient method is the intravenous, which produces greater concentration than any other and is practically instantaneous It is especially useful in tetanus and meningitis and would replace all others but for the mechanical difficulties in young children, and the risk of alarming rigors and other foreign protein reactions which may occur immediately (4) It is impossible to neutralize toxins which are fixed in the tissues no serum or special method of administration can prevent their later effects on heart kidneys or nervous system Tetanus antitoxin given after the appearance of clinical symptoms rarely saves a patient (5) Antibodies artificially introduced are rapidly eliminated from the system some soldiers developed tetanus after the effect of an initial prophylactic dose of serum had passed away (6) Monovalent serums may fail (especially in meningitis and pneumonia) because the disease is due to another strain of micrococcus than that from which the serum was derived Cushing has never seen a death from anaphylaxis in fifteen years experience he regards the danger as negligible Serum sickness he adds is not dangerous, and may be relieved by hypodermic injection of adrenaline All serums deteriorate in storage but less rapidly when kept in a dark, cold place Many samples on the market are quite inert

200 Epilepsy due to Osteitis of the Inner Table

A LÉRI and P COTTENOT (*Bull Soc Franc de Derm et de Syph*, May, 1924 p 243) recommend that in all cases of epilepsy in which signs of syphilis are absent and serum reactions are negative skiagrams of the cranial vault should be taken They report three cases which showed the three classic varieties of syphilitic osteitis *Case 1*—A girl aged 19 had had nocturnal attacks of Jacksonian epilepsy for three or four months, sometimes occurring twice or thrice in one week She had no sign of syphilis and the Wassermann reaction was negative but her mother had had several miscarriages A skiagram of the cranial vault showed a nodule on the inner table at the vertex just to the right of the middle line—that is over the cortical centre for the left leg the limb in which the premonitory symptoms commenced This was recognized as a gumma which disappeared save for a slight thickening of the inner table, after a series of bismuth injections The patient had one slight attack fifteen days after commencement of treatment no further attacks occurred during eight months *Case 2*—A woman aged 33 had had attacks of vertigo tinnitus and amblyopia with transient hemianopsia and coloured scintillating scotomata The fundi were normal The patient had had two healthy children there were no signs of syphilis and the Wassermann reaction was negative Bismuth injections were given and all symptoms disappeared rapidly After some time there was a relapse and a transient paresis of the left leg which suggested a cortical lesion Skiagrams showed extensive destruction of the inner table and of the diploë, especially over the right motor area In front of the bregma there was a long projecting irregular hyperostosis *Case 3*—A woman, aged 34 had an attack of Jacksonian epilepsy at the age of 12 Subsequent attacks continued for four years and then ceased until the age of 25 During the last four years they had been much more frequent The patient had no signs of syphilis, the Wassermann reaction was negative, and the cerebrospinal fluid contained 2 8 lymphocytes per cubic millimetre A skiagram showed a large exostosis 5 to 6 cm in length in the frontal region irregularly nodular, projecting 1 5 cm in yards The authors observe that bony lesions of these three types—(*a*) gumma (*b*) necrosis, and (*c*) exostosis—are found in both acquired and hereditary syphilis

201 Gangrene following Subcutaneous Injection of Saline Solution

E EICH (*Deut Zeit f Chir*, May 1924, p 410) states that unlike transfusion of blood, which has a very old history, injection of saline solution is of comparatively recent date It was chiefly during the great epidemics of cholera that visited Europe in the nineteenth century that it occurred to many physicians that fresh fluid might be introduced into the dehydrated system by a parenteral route Intravenous injection of saline solution was recorded by *Hermann* in Germany in 1830 and by Latta in Scotland in 1832, but the method gradually became forgotten, and it was not until about fifty years later that it became popular as the result of the investigations of Worm Müller, Cohnheim, Goltz and von Ott In 1883 after successful experiments in animals, von Ott performed the first subcutaneous injection of saline solution in a man who was suffering from cholera nostras In the cholera epidemic at Hamburg in 1892 subcutaneous injections of saline were extensively employed *Müller* in 1920 collected from German literature 13 cases of severe damages to the tissues following this method, and Eich has added 4 more including two of his own, so that the total amounts to 17 The chief factors in the damage to the skin following injection of saline solution appear to be anaemia of the tissues, circulatory weakness pressure exercised by the injected fluid and most of all, the addition of adrenaline, which should therefore not be used at all or be given intravenously or by mouth

202 Glycerin as a Vehicle for Bismuth Injections

S LOMHOLT (*Uge f rigt for Læger*, July 24th, 1924, p 569) finds that with the growing popularity of intramuscular injections of bismuth in the treatment of syphilis a better vehicle than oil is desirable Most bismuth preparations for intramuscular injection at present on the market are oily emulsions which though more readily absorbed than liquid paraffin, are yet slowly assimilated He found that the following formula gave excellent results precipitated bismuth hydroxide 2½ drachms, glycerin 1½ drachms, distilled water to 1½ drachms From 16 to 24 or 32 minims should be given every week and the syringe be cleaned frequently, since the bismuth is apt to make the piston stick in the syringe The needles also must be cleaned directly, after use, or they will be blocked The emulsion should be well shaken up immediately before use and as it is only slightly hypertonic the injections are practically painless Though he has already given several hundred injections the author has not yet had a case in which pain led the patient to discontinue treatment It is however, inevitable that this glycerin emulsion must cause a little more pain than an oil emulsion, for the former is absorbed several times more rapidly than the latter There is little risk of a glycerin emulsion giving rise to a depot of bismuth at the site of injection the action of the glycerin emulsion is much more rapid and powerful than that of an oil emulsion

203 Renal Diabetes

M LABBÉ (*Paris méd*, May 3rd, 1924 p 417) who records four personal cases, states that excessive permeability of the kidney to glucose was first described in 1895 by Lepine, who, from observations of the association of marked glycosuria with only a slight hyperglycaemia, came to the conclusion that there was a renal factor in the mechanism of glycosuria The following year Klemperer gave the name of "renal diabetes" to cases of glycosuria due to hyperpermeability of the kidney without hyperglycaemia Renal diabetes, though not frequent, is not extremely rare Salomon, indeed, who proposed the term "diabetes innocens, regards it as very common, and H John found it in 13 8 per cent of all cases of glycosuria The amount of sugar in the urine is usually moderate, ranging from 10 to 20 grams a day but is sometimes as low as 3 grams or as high as 79 or 100 grams Renal diabetes is not accompanied by symptoms of hyperglycaemia, such as polydipsia, polyuria, gingivitis, or a tendency to

suppuration, as in true diabetes It is generally persistent, but sometimes it is absent in the fasting state and appears only after meals An important characteristic is that diet has no effect upon the glycosuria, as in true diabetes Hyperpermeability of the kidney is not the only disturbance of kidney function in renal diabetes In a large number of cases albuminuria is present, as well as impermeability of the kidney to phenolsulphonephthalein Disturbance of hepatic function is also frequently associated with renal diabetes, as is shown by the occurrence of acidosis and urobilinuria In rare cases renal diabetes is associated with true diabetes Renal diabetes is occasionally found in several members of the same family, like alkaptonuria and cystinuria In cases reported by Cammidge and by Graham the father and daughter were affected In ten of Salomon's cases five belonged to two families Salomon has also seen renal diabetes in a brother and sister, and Labbé has seen it in two brothers.

Surgery.

204 Traumatic Cyst of the Pancreas

M H ROUVILLOIS (*Bull et Mem Soc Nat de Chir*, June 28th, 1924, p 728) records an interesting case of a traumatic cyst of the pancreas It occurred in a patient aged 21, following a violent kick in the epigastrium while playing football The cyst formed in the lesser sac of the peritoneum and the foramen of Winslow was obliterated. The stomach lay above and the transverse colon below the cyst The clinical features at the time of the injury did not indicate any visceral lesion, and the symptoms were simply those of a severe contusion without complications There persisted, however, a rigidity of the rectus muscle in its upper quadrant for a week after the accident this sign has been noted in a number of cases It was only after an interval of a month that the local and general signs showed the presence of the cyst, following these signs the cyst underwent spontaneous rupture, but later refilled and became even larger than before At the subsequent operation the cyst was exposed and punctured, it contained a yellowish opalescent fluid The cyst was sutured to the abdominal wall and drained The discharge from the wound was at first sterile, but later became infected with staphylococci The diagnosis in this case depended on the history of injury, the situation of the pain, and the abdominal rigidity, whilst radiographic examination was of some assistance The mode of approach through the gastro colic omentum appears the best and most favourable for drainage The convalescence was satisfactory except for the development of a pancreatic fistula for a time, which is common in these cases It was noted that the quantity of fluid secreted from the fistula was greater during the night than by day.

205 Sarcoma of the Rectum

L DURANTE (*Il Policlinico*, Sez Chir, June 15th, 1924, p 311), who states that the ano rectal localization of sarcoma is extremely rare, has collected 66 examples of melanotic sarcoma and 32 of non pigmented sarcoma, including a personal case The average age of the patients was 52 years, the youngest case was that of a boy, aged 10, with the non pigmented form, and the oldest that of a man of 90 with melanotic sarcoma Both sexes are equally affected In the great majority of cases the melanotic form arises in the anal portion of the rectum and the non pigmented form in the segment of the rectum above it The walls of the ano rectal segment are affected in the following order of frequency posterior wall 18 cases, anterior wall 3 cases, lateral wall 10 cases (Chumann) Sarcoma of the rectum is manifested clinically as a single, well circumscribed mass, with a nodular surface, varying in size from a hazel nut to an orange In 30 per cent of the melanotic cases and 70 per cent of the non pigmented cases it is sessile, while, on the other hand, it is pedunculated in 70 per cent of the melanotic cases and 30 per cent of the non pigmented cases In only a few instances does it first appear as a nodule beneath the intact mucous membrane, as in most cases the mucous membrane is already ulcerated when the growth is first seen The following forms have been described (1) Pedunculated form, to which Quenu and Hartmann have given the name of "malignant polypi" (2) Nodular form (3) Diffuse form, which is very rare, if it exists at all Histologically sarcoma of the rectum shows the same structure as that of sarcoma in other organs, the incidence of the different varieties being as follows round celled 40 per cent, spindle celled 33 per cent, mixed celled 20 per cent, giant celled 1 per cent, lympho sarcoma 4 per cent, myosarcoma 2 per cent Contrary to what is seen in epithelial new growths, sarcoma of the rectum is hardly ever associated with an appreciable diminution of the calibre of the intestine There is, on the contrary, often an increase in the size of the intestinal calibre due to paresis of the muscle tone It is only in the later stage that sarcoma shows any tendency to invade the neighbouring organs, such as the bladder, vesiculae seminales, uterus, and vagina There is a considerable difference in the clinical course of melanotic and non pigmented sarcoma The former shows a rapid growth with a tendency to invade early the lymphatic system, while the latter never invades the lymphatic system, except possibly at a late stage, and its growth is usually slow The prognosis of the non pigmented form is consequently less sombre than that of melanotic sarcoma The methods and indications for operation are the same in sarcoma as in carcinoma of the rectum.

206. Echinococcus Disease of the Lung

H VERGER, F PIÉCHAUD, and E AUBERTIN (*Paris med*, June 14th, 1924, p 551) describe the following varieties of echinococcus disease of the lung (1) The pseudo tuberculous form, in which the auscultation signs are localized congestion, paroxysmal cough, fever, emaciation, asthenia, and early or late haemoptysis (2) The pseudo pleuritic form, simulating sero fibrinous pleurisy, in which the cysts are situated in the cortex of the lung (3) The pleuritic form, due to rupture of the cyst into the pleura, or more frequently due to a pleural effusion caused by irritation of the pleura by the cyst (4) The type of intrathoracic tumour, in which the cyst projects from the thorax owing to the rib covering it being pushed forwards. (5) The suppurating cyst, in this form the symptoms are those of pulmonary abscess If the suppuration is secondary to the expulsion of clear fluid and fragments of membrane the diagnosis is easy, but if suppuration is the first sign the diagnosis is difficult unless characteristic hooklets and fragments of membrane are found in the pus If an operation is not performed cachexia develops The authors, who record a case of this kind in a woman aged 30, which was successfully treated by operation, emphasize the importance of the early use of *x* rays, as the radiological picture of this condition is characteristic

207. Surgical Treatment of Goitre.

A S JACKSON (*Annals of Surgery*, June, 1924, p 840) records conclusions based on a study of 4,000 cases of goitre Colloid goitres appearing at puberty are seen in 60 per cent of girls between the ages of 16 and 20 in the goitre district of the Middle West of America Factors in the etiology are deficiency of iodine, excessive demand on the thyroid glands, and undue mental and physical strain Colloid goitre may be prevented by administering 10 mg of sodium iodide once a week during school life Iodine gave good results in the ordinary type Adenomas tend to develop in neglected cases, they rarely cause symptoms before 25 years of age One in every four becomes toxic before 50 years of age, and the symptoms cause permanent and serious damage to the heart and kidneys Thyroidectomy is indicated in the majority of cases Carcinoma occurred four times in a hundred cases The mortality, when clinically diagnosed, was 100 per cent Malignancy does not occur in exophthalmic cases Jackson maintains that an adenoma is a neoplasm and a precursor of cancer, and so should be removed Exophthalmic goitre is more common in youth and has an acute onset Loss in weight may be rapid, and muscular asthenia is most marked in the quadriceps muscles The average basal metabolic rate is +54 per cent Before operation the vocal cords should be examined in all adenoma cases partial paresis is present in one in every fifteen cases, and if one cord is paralysed care must be taken not to injure the nerve supply of the other cord Local anaesthesia was used in 90 per cent of cases All haemorrhage must be carefully controlled at the operation, and, where better exposure is required, the sterno hyoid and sterno thyroid muscles may be divided Fluids and digitalin are useful after the operation X rays are only used in exophthalmic cases, prolonged treatment is necessary and the results are variable

208 Suprarenal Tumours with Cerebral Symptoms

A DEVIC and J DECHAUME (*Journ de Méd de Lyon*, July 5th, 1924, p 397) record two interesting cases of suprarenal tumours giving rise to cerebral symptoms The first occurred in a patient 59 years of age, the second patient was 35 years of age From a review of the few recorded cases it appears that these primary tumours arise in the cortex of the suprarenal and in young subjects Before the tumour itself attains any great size metastases appear in the viscera and the central nervous system Clinically the tumours give no localizing signs of their presence, and being small cause no pressure effects on neighbouring organs The absence of signs of disturbance of the internal secretion of the organ is always striking Even though the growth may cause a complete change in the structure of the suprarenal, signs of acute insufficiency of the secretion are absent There was no evidence of Addison's syndrome in their cases Even the marked asthenia, rapid cachexia, and lumbar pain were

not noted In such cases the disease is first recognized by the presence of the secondary deposits Frequently metastases in the lungs are the earliest discovered Following on this the cerebral symptoms may be attributed to a tumer culoma secondary to a lung infection to which it bears some resemblance Finally the cervical glands may become enlarged, and examination of one of these shows the nature of the growth In one of their recorded cases there was a definite Jacksonian syndrome In the second case there were only general signs of cerebral involvement with papilloedema, headache, vertigo, and vomiting It appears, therefore that the diagnosis of this condition is practically impossible

Dermatology.

209 **Osteosis Cutis**

S W BECKER (*Arch Derm and Syph*, August, 1924, p 162) reports a case in which a hard resilient plaque containing osseous tissue developed in the scalp of a woman aged 32 The condition had been present for fourteen years, during which time mechanical irritation had given rise repeatedly to ulceration and the formation of crusts, the patient said that bone like bodies had come out from time to time There was no history of injury By microscopical examination ovoid and irregular islands of true bone with a lamellar configuration were discovered in the corium A membrane resembling the periosteum was present, there were marrow cavities with endosteum, lacunae, and irregular and transversely radiating canaliculae No other calcified tissue and no cartilage were present The simultaneous occurrence in the patient of a mild generalized hypertrichosis a keratosic naevus of the sole of the foot, and a naevus pigmentosus of the finger suggested that the osteosis might have been a naevus formation The author provides a bibliography of ossification in the skin

210 **Hexamine Dermatitis.**

H J CROTTY (*Journ Amer Med Assoc*, July 26th, 1924 p 250) reports the poisoning by hexamine of sixty employees in a rubber factory acute dermatitis of the exposed surface being the principal symptom Hexamine was used in the vulcanization of rubber, an ounce or two being introduced into the average bath of 100 lb or more rubber stock The first symptoms were redness of the face and exposed parts of the arms followed by the development of vesicles and later of oedema Extreme itching was the chief symptom complained of, but many of the patients later developed deep infections which resisted treatment At first sodium bicarbonate and glycerin washes were found useful in the less severe cases but later a protective zinc ointment containing 25 per cent crude coal tar was found to be more effective, combined with the internal administration of bromides The disease recurred when the patients returned to work, and after various preventive measures had proved unsuccessful the hexamine process was given up

211 **Impetigo treated by Staphylococci**

FONTEYNE (*Le Scalpel*, June 7th, 1924, p 673) has been treating with success cases of impetigo by the external application of a culture of staphylococcus The number of cases treated was small, but they were selected for their obstinacy, and chronicity the eruption was on the head in every case The head was washed each day with soap, and no antiseptic was used At first the culture was applied as a moist dressing, but this became so foul in a short time that the method was abandoned and the affected parts simply washed with the medium three times a day and left open

Obstetrics and Gynaecology.

212. **Puerperal Insanity**

A W BOURNE (*Brit Journ of Obstet and Gynaecol*, Summer Number, 1924, p 251) has analysed the history of 61 cases of puerperal insanity, collating the clinical notes made in lying in homes and later in infirmaries and asylums In nine of the cases no evidence was obtained either of predisposition to mental disease or of physical puerperal disease Of these patients five were single so that it was possible that the worry of illegitimate pregnancy might be of etiological moment—a view which was borne out by the finding that no fewer than 36 per cent of the whole series were unmarried Of the 61 patients, 18 showed evidence of uterine infection and 9 had eclampsia Primiparae formed 59 per cent of the total In 27 per cent predisposition to mental disease was indicated by the family or personal history The mortality in the series was 22 per cent, 6 patients died of the effects of infection 2 of cardiac failure, and 2 by suicide Of the survivors who were traced, 75 per cent were eventually discharged from asylums as recovered The 6 patients with eclampsia that were traced had all recovered, but of 13 cases of uterine infection 6 died The time before recovery varied from two weeks to three years, the average time being six and a half months Bourne concludes that there is evidence that puerperal organic disease particularly sepsis and eclampsia, is capable of inducing insanity in those who have not shown previous indications of mental unsoundness and who family history in this connexion is good The prognosis he says, depends primarily on the severity of the coincident organic disease if any eclampsia produces only a brief period of insanity but half the patients who died were victims of infection and of the traced cases of infection the same proportion was fatal

213. **Sarcoma and Adenocarcinoma in the same Uterus**

T S MOISE (*Surg, Gynecol and Obstet*, July, 1924 p 83) reports a case of the occurrence of sarcoma and carcinoma in the uterus of a patient aged 60, who was admitted to hospital with vaginal haemorrhage She had married at the age of 19, and had given birth to four children She had had no miscarriages The menopause occurred at the age of 50 two years later she had a fall after which she complained of a heavy sensation in the pelvis and noticed that the uterus was prolapsed Eighteen months later her health became poor, she lost weight, and the haemorrhage commenced A diagnosis of carcinoma of the cervix was made and the uterus was removed, no metastases being detected For three or four weeks after the operation the patient was quite comfortable, then hard lumps developed between the operation incision, there was severe pain in the back, and difficulty in defaecation She became steadily weaker and developed a cough with blood stained sputum, tightness in the chest and difficulty in breathing Death followed a week or two later The pathological examination of the uterus brought to light typical round celled sarcoma of the body of the uterus associated with an adenocarcinoma, which was atypical being spread in the form of small papillae over the endometrium There was widespread invasion of the uterine wall by nests of carcinomatous cells Moise discusses this condition at length and refers to Herxheimer's researches and conclusions with regard to its origin He adds that the majority of authors appear to believe that the sarcoma is the older growth and that the carcinoma develops as the result of epithelial proliferation over the sarcoma

214 **Uterine Haemorrhage after the Menopause.**

P MONTLONGUET POLERIS (*Gynecol et Obstet*, 1924, ix 6, p 493), without combating the accepted view that metrorrhagia appearing several years after a well established menopause is in a large percentage of cases symptomatic of carcinoma of the corpus uteri, points out that it may be due in other instances to senile metritis, polypi tertiary syphilis or to neoplasms, or cysts of the ovary Of post menopausal haemorrhage due to the last named cause he cites 52 cases, of which 26 had not hitherto been published Uterine haemorrhage is by no means an invariable accompaniment of ovarian tumours or cysts developing after the menopause, but was found in one fourth of a series of 74 cases The bleeding is not usually acute or so severe as to produce a notable degree of secondary anaemia, possibly because the patient as a rule seeks treatment on a comparatively early date There is not infrequently a considerable amount of leucorrhoea Painful uterine contractions, such as occur in cancer, are not noted Physical examination may or may not lead to detection of an adnexal swelling this may be very small The ovarian tumour is not in the majority of cases malignant, the series of cases reported included mucous, Wolffian, serous and vegetating cysts, fibromata, and all varieties of solid malignant growths On examining the uterus in these cases the author has generally found evidence of endometrial hyperplasia which may go on to polyp formation but without any formation of decidua like cells Clinical diagnosis of these cases is difficult especially when the ovarian tumour is small it is usually to be made after surgical intervention for suspected carcinoma of the uterine body The author regards the endometrial changes as a rejuvenescence probably under the influence of stimulation of the juxtaovarian and broad ligament nerve fibres

215. **Hyperemesis Gravidarum**

S BRINDEAU and P LAMBOUL (*Paris méd* June 21st 1924, p 587) remark that the results of empirical treatment of hyperemesis gravidarum are neither better nor worse than those of treatments based on pathological investigations Diagnosis of the condition is less simple than is thought by obstetricians In fatal cases the diagnosis is not certain save after autopsy, intractable vomiting in pregnant subjects has wrongly been regarded as hyperemesis gravidarum when in reality due to tabes, cerebellar granuloma, choroid plexus

tumours, or to cystic or gliomatous cerebral tumours. According to the usual statements hyperemesis gravidarum is most nearly simulated by nervous or hysterical vomiting, which is susceptible of cure by suggestion. Hysterical vomiting is not rare in those who previously have shown no neuropathic taint, and it is to be noted that the morbid conditions which it may secondarily induce—dehydration, acidosis, etc—will naturally not respond to suggestion, and may be of extreme gravity. Patients with almost continuous vomiting, wasting, tachycardia, icterus, and salivation may be so ill that therapeutic abortion is regarded as essential, and yet they may be cured by the suggestion that they are not pregnant, or by other simple psychotherapeutic treatment. It is probable that in some such cases death has ensued. The authors believe, with others, that there is no clinical symptom which suffices to distinguish hysterical vomiting from true intractable or "toxaemic" vomiting of pregnancy. The therapeutic test is less simple than at first it seems, hysterical vomiting should yield to suggestion, but, although vomiting which does so yield is without doubt hysterical, vomiting which does not is still possibly hysterical. Suggestion varies in potency when employed by different practitioners, and is frequently useless unless the patient is absolutely isolated from her previous surroundings and friends, it is powerless against secondary morbid organic conditions following hysterical vomiting. Turning to the question, Is there such a condition as grave intractable vomiting, organic and not hysterical, due to pregnancy? the authors hesitate to state a negative, but believe that the immense majority, if not all, of these cases are of hysterical origin. They point out that grave cases are almost unknown in patients who have had skilled advice from the beginning of their symptoms, that striking cures follow the most diverse treatments and are of remarkable rapidity, that death of the foetus *in utero* and spontaneous abortion are uncommon, and that grave hysterical vomiting is far from rare in the absence of pregnancy and also in males. The authors attach the greatest importance to the institution of treatment by isolation and suggestion at the earliest possible date.

Pathology.

216 Laboratory Tests for Syphilis

M. H. EBERT and J. H. MITCHELL (*Arch. Dermatol. and Syphilol.*, July, 1924, p. 36), from a comparative study of the Herrold precipitation test and the Wassermann test, conclude that the precipitation reaction is specific for syphilis, agreeing with the Wassermann reaction in untreated secondary and congenital syphilis, but becoming positive later than the Wassermann in untreated primary syphilis, it is less sensitive in treated cases and later in the disease. In syphilis of the central nervous system the precipitation test is unsatisfactory, as the reaction was negative in a relatively large number of cases which gave a strongly positive Wassermann reaction. Although in a small number of cases in which the Wassermann reaction is negative the precipitation test gives a positive result, it is a valuable routine control on the Wassermann test, and it is useful clinically if carefully carried out. It is unsatisfactory with lipaemic serums. A total of 2,025 tests were made, 1,075 being in syphilitic cases, 885 in non-syphilitic cases, and 65 in cases in which no history was available.

217 Pulmonary Fats and the Fixation of Calcium.

FOLLOWING on their demonstration of the presence of vitamin A in the fat contained in the lungs, and of its beneficial effect on growth, H. ROGER, L. BINET, and M. VAGLIANO (*C. R. Soc. de Biologie*, July 11th, 1924, p. 357) have now succeeded in showing that this fat contains also an antirachitic vitamin which is able to assist in the fixation of calcium by the body. Young rats, one month old, were placed on a dietary (Pappenheimer's 85) consisting of wheat flour, egg albumen, butter, and a mixture of various salts, and were kept in the dark. After a fortnight they were found to be suffering from rickets, as was shown by a macroscopical and microscopical examination of one of them, and they were then divided into three groups. Group 1, which was kept on the same diet, was killed off at the end of another fortnight, and the animals composing it were submitted to a histological study. On the inner side, particularly, of the ribs at the costo-chondrial junctions there were marked nodosities, which microscopically showed the usual lesions of experimental rickets. The animals of Group 2 were put on to a dietary in which the butter was replaced by 2 per cent. of fats extracted from the lungs of the dog by means of alcohol and ether. They were killed after a fortnight, no appreciable lesions were found at autopsy, and microscopical examination of the costo-chondrial junctions showed the picture of healed rickets. The animals of Group 3 had their butter replaced by 3 per cent. of extract of lung fat, and were killed after ten days. They too showed evidence of healed rickets. The beneficial act of this fatty extract of lung could be ascribed either to its existence in it of an antirachitic vitamin or to its phosphorus content. Analysis, however, showed that the amount of phosphorus was only 1 per cent.—an amount which is insufficient to prevent or to cure rickets on this particular dietary. They therefore conclude that the fats of the lung contain over and above a vitamin requisite for growth, an antirachitic vitamin which enables the animal body to fix calcium.

218. Serology of the Streptococcus scarlatinae.

F. A. STEVENS and A. R. DOCHEZ (*Journ. Exper. Med.*, August, 1924, p. 253) have carried out an examination of the serological properties of the streptococci isolated from cases of scarlet fever. A number of strains were collected from diverse sources, with one exception they were all isolated from throat cultures, the single exception was a strain obtained from milk incriminated in an outbreak of scarlatina. Six control strains of pyogenic streptococci from infected wounds, and two others isolated from throat cultures of patients suffering from epidemic sore throat of non-scarlatinal nature were studied at the same time. Agglutinating serums were prepared to fifteen of the twenty-one scarlatinal strains by injecting rabbits first with heat-killed broth cultures, and later with living broth cultures, care being taken to exclude all animals which had natural agglutinins to streptococci in their serum. Direct agglutination tests were performed by putting up each of the immune serums obtained against both the scarlatinal and the control strains. The results showed quite clearly that with a few exceptions all the scarlatinal strains were agglutinated by all the serums, whereas the control strains were left unaffected. The serum prepared against the streptococcus isolated from milk agglutinated the scarlatinal strains as satisfactorily as did the serums prepared from strains isolated from throat cultures. Absorption tests were then performed with five of the serums, using those strains which were agglutinated with the greatest rapidity. These tests were on the whole fairly satisfactory, showing that the scarlatinal strains were able to remove the homologous agglutinins from the serums, the control strains generally succeeded in reducing the titre to a [illegible] but were never able to remove all the [illegible]. From these observations they conclude that streptococci isolated from scarlet fever are haemolytic streptococci coming from other sources, and distinct from streptococci isolated from [illegible] as that they can be identified by agglutination tests.

219 B. putrificus and Gas Gangrene

THE part played by *B. putrificus* in the production of foul smelling infections has not been fully ascertained. This anaerobe has been recovered from dental caries, intestinal inflammation, and infected wounds, but attempts to reproduce these infections experimentally have not been successful hitherto. M. WEINBERG and B. GINSBOURG (*C. R. Soc. de Biologie*, July 5th, 1924, p. 339), noting that this organism only occurs in wounds associated with aerobic and anaerobic bacteria, have endeavoured to reproduce this condition experimentally by combining the organism with such organisms as *B. perfringens*, *B. sporogenes*, *B. proteus*, *B. coli*, and the bacillus of malignant oedema. The strain of *B. putrificus* employed had proved to be non-pathogenic in pure culture. When associated with *B. putrificus* or *B. perfringens*, however, and to a lesser extent with *B. sporogenes*, a very marked effect resulted from its intramuscular inoculation into guinea-pigs. The ensuing lesions were, however, nearly always limited to the skin, and only rarely did degenerative changes appear in the muscles. Partial breaking up of the muscles occurred with a mixture of *B. putrificus* and *B. histolyticus*. When other organisms were employed mixed with *B. putrificus* the lesions were less marked, more transient, and always localized in the skin. The authors suggest that these facts indicate a certain affinity of *B. putrificus* for the skin. When *B. putrificus* was associated with another proteolytic organism, such as *B. sporogenes*, marked lesions occurred, but these were very transient and the animal recovered in two to four days. When a mixture of *B. putrificus* and *B. coli* was employed the anaerobe disappeared rapidly from the wound, but *B. coli* persisted and multiplied rapidly, death followed, and the animal showed a haemorrhagic gelatinous oedema of the subcutaneous tissue over the whole abdominal wall, the viscera, especially the suprarenals, being swollen and very congested. This experiment indicates, not only the antagonism between these two microbes, which had been previously demonstrated by Bienstock, but also that this mixture increases considerably the virulence of *B. coli*. Similar results were observed in the association of *B. putrificus* with *B. proteus*. *B. putrificus* is not so strongly proteolytic as *B. sporogenes*, and breaks up protein matter slowly. It seems to play an important part in the more chronic forms of inflammation—as, for example, in wounds and in infections of the intestine.

The Favourable and Certain Effects of

GAMELAN

upon Pulmonary Tuberculosis and upon Surgical Tuberculosis

RESULTS of the SCIENTIFIC RESEARCHES

GAMELAN, which is composed of various fatty lipoid and waxy substances of the constituents of the Koch bacilli increases the lipolytic powers of the organism It has a solvent action upon the tubercle bacillus by means of saponification of its fatty or wax capsule the virulence of the bacillus is thus reduced

GAMELAN has proved efficacious in the course of prolonged experiments on animals and in the course of clinical tests carried out during a period of years

GAMELAN really does away with night sweats, even in cases where all other remedies have failed
It alters the blood-picture, polynuclear cells giving place to lymphocytes and eosinophils
The coughing and expectoration diminish, and cease in favourable cases
The number of Koch's bacilli in the sputum becomes smaller and smaller
The temperature becomes normal again, this has been observed more especially in surgical cases
There is new formation of the bony tissue

GAMELAN brings about a distinct improvement both subjective and objective in the general condition and also an increase in appetite and weight
A factor which makes Gamelan very valuable is the absence of any local or general reaction the patient's powers therefore remain intact
Gamelan is introduced into the system by means of subcutaneous injections and cutaneous rubbings

Proprietors of Prunol etc.

REPORT OF THE STATUTORY MEETING.

The Statutory Meeting of Prunol Limited was held at 12 o'clock noon on Tuesday, September 2nd, 1924, at the Registered Offices of the Company, 4, Pickering Place, St James's Street, London, S W 1

The SECRETARY, having read the notice convening the Meeting, the Chairman, Mr H M ALLEYN, said —

This Company was registered as a Private Limited Liability Company on July 8th, and the Statutory Meeting to day is held to comply with the requirements of the Companies Acts

Although there is no official business to transact, may I take this opportunity of welcoming you, gentlemen, to these very charming and old world quarters in which we have the good fortune to be housed No 4, Pickering Place, dates from the 17th century, or earlier, and is said to have been at one time the residence of Nelson's Lady Hamilton This is perhaps in keeping with the somewhat romantic origin of this Company, as Prunol Limited was formed to supply, for the benefit of the public, an old-world remedy, which has been more than favourably known to the Medical Profession for over half a century as a home-made family preparation of the greatest value, a remedy to which my little son is indebted for his present good health, and probably for his life

An interesting feature about this Company, gentlemen, to which I may refer, is the fact that our Shareholders, with two exceptions, are entirely Ceylon men As in the old days, the Rubber Plantation Industry was started and financed with Ceylon money, so to-day we have in a small way another example of the Colonial spirit of enterprise to which we owe so much in this country

Prunol Limited was registered with an initial capital of £5,000, of which a limited number of shares are still available for those who may care to join in this, our adventure

Our programme is a clearly defined one We intend to advertise the Company's products and to build up the finances of the Company out of profits, and not out of capital My own personal experience a few years ago, when introducing the Domes of Silence, showed that on a capital of £250 it was possible to realize a net profit of over £3,200 on the first year's trading, after meeting an advertising expenditure of over £15,000 during the year

We may agree, gentlemen, that Prunol Limited is a speculative investment, but, in my opinion, we stand less risk of failure than many of the best known engineering and manufacturing businesses of the present day Our market conditions are not affected by any political or communistic conditions The question of import and export duties or rates of exchange does not worry us We are, to all intents and purposes, immune from strikes, a recognized trade mark, a recognized branded name, and a remedy that humanity needs, does not suffer from competition once it is known to and appreciated by the public Such competition as there may be later on can be readily met in various ways, and, instead of reducing, should be utilized to increase the profits and to improve the goodwill of the Company

Although the Board of the Company is a small one, it has, in my opinion, the necessary qualifications that make for the successful conduct of any business—namely, experience and common sense

Mr Middleton is a Director and adviser, on the accountancy side, to a well-known Company, whose posters you see on every hoarding Captain Legge, R N R, who represents the majority of our Ceylon subscribers, is a gentleman who was well known in Ceylon, and a successful administrator of an important departmental position in the Island My personal experience of that most costly, difficult, and yet most remunerative branch of business, Advertising, has been, as you probably know, undoubtedly successful, so that as a Board, we hope we are, in your opinion, reasonably well equipped to meet whatever changes and chances the future may bring

As a Company we possess an outstanding advantage in our trade mark, "The Symbol of Life" A trade mark which will, we hope, be made familiar throughout the world in the course of a very few years as the sign manual of the Prunol Preparations Our trade mark will be found to attract unconsciously the eye of every reader of a periodical or newspaper in which an advertisement of ours is inserted This effect may be noted in to-day's issue of the *Daily Mail*, so that for an expenditure of £1 in a small advertising space

Printed and published by the British Medical Association at their Office No 429 Strand, in the Parish of St Martin in the Fields, in the County of London

we obtain the value of from £3 to £4 of space publicity Multiply these figures by 1,000, or by as many thousands as the Company may in the course of years to come expend, and you will appreciate the concrete monetary value of our trade mark in building up by means of publicity, a goodwill for the Company's products at a minimum expense

In addition to the most valuable Recipe of Prunes Demerara Sugar, Senna and Ginger, which we are marketing as a branded and proprietary line, the policy of the Company will be to introduce other equally satisfactory remedies The value of ginger for indigestion has been known to the Chinese for centuries It is an aromatic and stomachic cordial and in its proper form is an almost certain cure for most of the evils of indigestion Yet its efficacy depends on the form in which it is administered when prescribed in medical prescriptions as pulverised or dried ginger it is usually more detrimental than beneficial The new preparation will be placed on the market under the name of Prunol Syrup of Ginger," and will be prepared for us, as in the case of our Prune Jelly, by a manufacturing firm of the very highest repute in Great Britain

It is early yet to talk of these and other developments which we may have in mind, but we trust in time to place on the market various branded recipes of proven value for the safe treatment of most of the minor ills of modern life to which so many of the major ills owe their origin In other words, we trust to furnish the family medicine chest with standard and approved remedies that can be relied upon with confidence for use from the dawn of childhood to the sunset of life You may consider our programme an ambitious one, but it does not follow that we propose to run before we can walk It is the intention of this Board to use that great quality Patience to a much greater extent than Capital in securing the necessary approval and support of the public for our goods

We have been fortunate enough, through the enterprise and goodwill of our Advertising Agents, to arrange a contract with the *Daily Mail* for the insertion of an advertisement twice weekly on what we consider the most suitable page of the paper In my opinion, each ten copies of the *Mail* are read by at least fifteen people On this basis our expenditure per reader of the *Mail* during the period of an entire year will slightly exceed one farthing per reader In return for the expenditure by us of one farthing per reader, each reader of the *Mail* will have before him twice each week, or 104 times during the year a well-worded advertisement pointing out the advantages of our products I am personally a great believer in steady and persistent publicity, addressed to the same people week in and week out It only a very small percentage of readers become buyers it places this Company in a position of exceptional financial strength and profit earning capacity for direct sales involve the stocking of our goods in reasonable quantity by all chemists and druggists Thus if only one in ten of every reader of the *Mail* purchases one of our branded specialities once a year the profit income of this Company should be from four to five times as much as its total authorized capital, yet every reader of the *Mail* will have our preparations placed before him not once, but 104 times during the course of each year

We do not claim to cure cancer or consumption or any of the other great scourges of the human race but we do claim that our remedies will in many cases do much to prevent and hinder their genesis and growth

Before concluding, gentlemen I should like to mention the further developments we have in mind as regards our Colonial Dependencies the great overseas markets of the world and the continent of Europe It is proposed to form almost immediately, a separate Company, in which this Company will take an interest to place the Prunol Preparations on the French, German, Italian and other markets of Europe Each country will be dealt with separately and in sequence When a success is made of one country, and local capital has been arranged for, the Prunol Specialties will then be introduced to another and different market In other words, in introducing Prunol we shall adopt the Roman method of breaking a bundle of rods, by dealing with each country separately and in sequence Full particulars of the capitalization of the new Company and all other details may be obtained on application to the Secretary, at this address by those who may desire to take a financial interest with us in what should prove to be a sound, and, we hope, and exceptionally remunerative venture

In conclusion, gentlemen, I should like to personally thank you for your support, and to congratulate you on the enterprise you have shown, an enterprise which will, I feel sure, prove as successful as even the most optimistic among us may desire

A resolution appointing Messrs Middleton and Hawkins, Incorporated Accountants as Auditors to the Company having been duly proposed and seconded, was carried unanimously

The Meeting concluded with a vote of thanks to the Chairman

This form may be cut out and posted to the Secretary, Prunol Ltd , 4, Pickering Place, St. James's St , London, S W 1

SIR —I am interested in the Report of your Company's Statutory Meeting, and I shall be obliged for any further particulars you may be prepared to supply

ATOPHAN

TRADE MARK

The *original* preparation which has the property of stimulating the excretion and arresting the formation of uric acid to a degree hitherto unknown

A large volume of evidence shows the value of Atophan in the treatment of **acute and chronic gout, rheumatism, and all affections associated with the uric acid diathesis**

Atophan is a powerful analgetic, antipyretic, and antiphlogistic, and, in addition, it exercises an astoundingly rapid stimulating action on the hepatic functions

ATOPHAN COMBINATIONS

ICTEROSAN — Specific in cholæmic jaundice where no mechanical obstruction is present One injection is usually sufficient to produce an immediate flow of bile In ampoules of 5 c cm

ARCANOL — A combination of Atophan and Acid Acetyl Sal, which has proved of great value in influenza and all diseases associated with chill In tablets of 15 grs

ATOPHANYL — **For injection.** The parenteral administration of Atophan in this form is especially indicated in rheumatism, sciatica, neuralgia, neuritis, etc The action is prompt and extremely vigorous In ampoules of 5 c cm

WITH SUPPLEMENT.

No 3326 SATURDAY, SEPTEMBER 27, 1924. Price 1/3

Parathyroid in the Treatment of Sprue

Parathyroid Gland Tablets
(P D & Co)
Each containing either 1/20 grain (3·2 mgm) or 1/10 grain (6·5 mgm.) of desiccated substance
In bottles of 25 or 100 tablets

Parathyroid and Calcium Tablets
(P, D & Co)
Each containing 1/40 grain (1·6 mgm.) of desiccated parathyroid gland and 5 grains (325 mgm) of calcium lactate
In bottles of 25 or 100 tablets

Calcium Lactate Tablets
(P D & Co)
Each containing 5 grains (325 mgm.) or 10 grains (650 mgm.)
In bottles of 100 or 1000 tablets

FURTHER reports of the success attending the administration of parathyroid and calcium in the treatment of Sprue are given in the *British Medical Journal*, August 23rd, 1924. In such cases it is obviously essential that only genuine parathyroid preparations should be used. The precautions taken by Parke, Davis & Co in the manufacture of Parathyroid Tablets enable them to guarantee that at least 90 per cent of the desiccated substance employed is parathyroid tissue

Parathyroid medication is also indicated in —

CHRONIC ULCERATIO (varicose, gastric duodenal)
DISEASES OF THE NERVOUS SYSTEM (chorea epilepsy, tetany)
VASOMOTOR NEUROSES (Raynaud's disease, angioneurotic œdema)
DISTURBED ENDOCRINE FUNCTIO (osteomalacia hyperthyroidism)

Our booklet—"Parathyroid Therapy"—will be sent post free to any medical practitioner on request.

46 Illustrations 15s net postage 6d.

APPLIED PHARMACOLOGY

By A J CLARK, M C M D F P C P Professor of Pharmacology in the University of London

This book differs much from other pharmacologies It does not treat of all the bare facts of pharmacological action but only of those great events which have brought to the front The work will be very useful to all practitioners who desire a practical knowledge of remedies which will bring them up-to-date in the application of modern physiological dogma to ordinary therapeutics They have in every day use The charm of the book lies largely in the fact that it gives in readable and intelligible literary language what every practitioner wants to know about his drugs"—LANCET

AT THE THIRTEENTH ANNUAL CONFERENCE

of the British Commercial Gas Association to be held at Liverpool on September 29th, 30th, and October 1st, 1924, there will be a discussion on "Gas as an Aid to Health," and papers will be presented dealing with.

(1) Gas Lighting, Eyesight and Health
(2) Gas as a Dirt and Labour Saver
(3) Gas as an Aid to Purer Air
(4) Gas as a means of Healthy Heating

Full reports of these papers, which contain many convincing pronouncements by independent authorities, will be available after the conference, and copies will be sent, free of charge, to anyone interested on application to the Secretary of the undermentioned body

THE BRITISH COMMERCIAL GAS ASSOCIATION

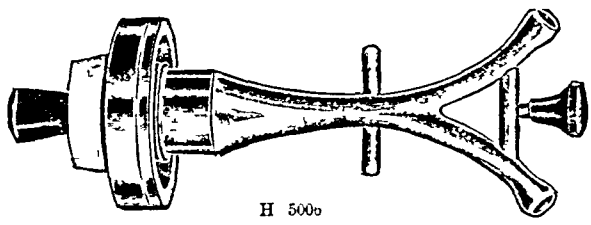
Our Japanned Surface has been used with Bodies in the country

A pound saved is as good as a pound donated

Hospitals can make their equipment and furniture as good as new—and save much expense—by having it re enamelled with Price's Porcelain Solution



Let Price s do it in the way that 60 years' experience has taught them it should be done
Work done Price s way gives a hard durable finish which will not crack—thus minimising the danger of bacteria collecting
Moreover the surface can be washed with disinfectant, turpentine or methylated spirit—with out fear of damage
Price s prices are moderate and the most modern plant is at your service for japanning and enamelling

Write for our representative to call and estimate

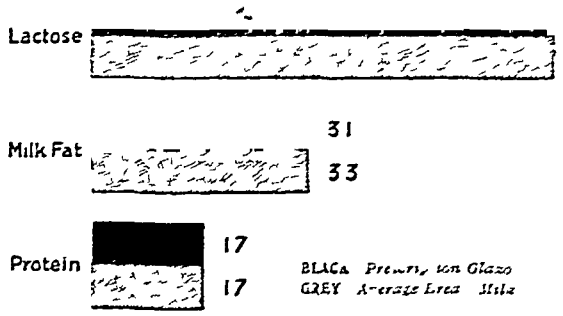
A NEW ADVANCE IN THE SCIENCE OF INFANTILE DIETETICS

Prescription Glaxo



(HUMANIZED MILK)

A new form of Glaxo—prepared under the direction of an eminent Specialist—which by simple dilution (1 in 8) provides a milk in which the proportions of Fat, Carbohydrates (Milk-sugar), and Protein are identical with human milk

ANALYSIS of PRESCRIPTION GLAXO

(When reconstituted 1 in 8)

As compared with average breast-milk

Specially recommended for those mothers who are unable to breast-feed their babies, and for supplementary feeding when the mother's milk is deficient in quantity or quality.

Prescription Glaxo can be obtained direct from Glaxo through your usual Chemist.

Write for Clinical Reports and Samples to

Medical Dept., GLAXO HOUSE, 55, Osnaburgh Street, LONDON, N.W.1

Extracts from a report on Infant Feeding with Prescription Glaxo at a London Hospital

CASE No 1A.—Infant three weeks old, weight 7 lb 1 oz. Birth weight was 9 lb. Had been breast-fed for two weeks and then given cow's milk and barley water. Infant had diarrhœa and vomiting. This infant gained 2 lb in a month on Prescription Glaxo

CASE No C4.—Infant one month old had only gained 4 oz. since birth. Was already having supplementary feeds of cow's milk and barley water. Gained 1 oz in 14 days on Prescription Glaxo

Vaccination complications yield to this treatment

WHERE the vesicles inflame and deep excavated ulcers result, Antiphlogistine is indicated. Applied hot, it at once increases leucocytosis, because it increases the superficial circulation by detouring the blood through the compensatory venous system.

Next by its hygroscopic property it sets up Osmosis, whereby the fluid exudate of the inflammation is drawn out through the porous membrane of the skin and absorbed by the poultice.

Simultaneously, by endosmotic action, the non toxic antiseptics of eucalyptus, boric acid and gaultheria in Antiphlogistine are cleansing the affected area.

The bad arm does not manifest until after "the take," so that the antiseptic action of Antiphlogistine does not annul the efficacy of the vaccine virus.

The use of Antiphlogistine is endorsed by Physicians everywhere as a most valuable aid in all cases of Vaccinal ulceration, Impetigo, Glandular abscess, Septic infection, Erythema, Urticaria, etc.

A reparative action both scientific and rational

The action of Antiphlogistine in *removing the exudate of congestion* is both scientific and rational.

Apply like a poultice. Heat a sufficient quantity, place in centre of a gauze square, cover the affected part completely with the Antiphlogistine, and bind snugly with bandage.

Antiphlogistine
TRADE MARK

"Promotes Osmosis"

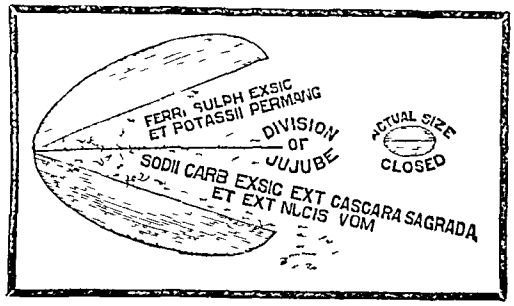

Diagram represents inflamed area. In zone C blood is flowing freely through underlying vessels. This forms a current away from the Antiphlogistine, whose liquid contents therefore, follow the line of least resistance and enter the circulation through the physical process of endosmosis. In zone A there is stasis no current tending to overcome Antiphlogistine's hygroscopic property The line of least resistance for the liquid exudate is therefore in the direction of the Antiphlogistine. In obedience to the same law exosmosis is going on in this zone, and the excess of moisture is thus accounted for

Antiphlogistine poultice after application. Center moist, Periphery virtually dry

HEWLETT'S
ORIGINAL PREPARATIONS.

ANTISEPTIC CREAM
(Cremor Antisepticus)
(HEWLETT'S)

A delicate antiseptic emollient healing Cream, instantly relieving the itching and burning sensation of the skin in cutaneous diseases Its healing and soothing properties are widely recognized in the treatment of Wounds

Price, in Collapsible Tubes, 18/- per doz, or 5, 10, 22, 40, and 90oz Jars, 5/6 per lb

IODERMIOL
(HEWLETT'S)

A bland emollient and non irritating preparation of Iodine, superior to the Tincture of Iodine in strength, yet causes no stain or inflammation of the skin after application.

It is easily absorbed under the influence of gentle friction It does not harden the skin like the ordinary tincture, liniment and ointment, but leaves it soft and supple, and perfectly free from stain.

DIRECTIONS FOR USE—Rub the affected part well with IODERMIOL until the Iodine is completely absorbed as indicated by the disappearance of the colour The only residue left on the skin may be washed off if desired with soap and water

PRICE 1/ PER OZ. 14/ PER LB.

MIST. SENECIO CO.
(HEWLETT'S)

An elegant and effective combination of Senecio, Hydrastis, Pulsatilla, and aromatics, which has proved very efficient in Amenorrhœa, Dysmenorrhœa, and Menorrhagia The compound has a most beneficial effect in Dysmenorrhœa, relieving the pain and regulating the flow In acting more particularly on the uterine nerves, it is of special value in the non inflammatory form of Dysmenorrhœa When anæmia and chlorosis are present, iron is an essential part of the treatment, but MIST SENECIO CO is useful as a general uterine and nervine tonic.

PRICE 12/6 PER LB.
In 5oz 10oz. 22oz. 40oz AND 90oz. BOTTLES.

HORMONIGEN
(HEWLETT'S)

Hormonigen Tablets (Hewlett's) contain the hormones of the thyroid pituitary ovary and testes

Useful in Neurasthenia and all asthenic conditions obesity, chronic cardiac cases aplasias of the pluriglandular system and in anæmia In Amenorrhœa Dysmenorrhœa and at the Menopause Hormonigen is particularly effective and even in chlorosis

If there is high blood pressure Hormonigen Sine Pituitary is indicated

Peptonised Beef Jelly

(Benger) *An agreeable & highly-nourishing Invalid Delicacy*

For those numerous cases in which solid nourishment cannot be safely prescribed, a palatable and nutritious food can be found in Benger's Peptonised Beef Jelly.

This preparation combines in an unusual degree the qualities of assimilability and high-nutritive content. It is superior to "Beef tea," as the meat itself is made soluble by the action of digestive enzymes.

The Jelly can be served either cold with biscuits, or dissolved in hot water as a soup-beverage It is sold in hermetically sealed glass jars, ready for immediate use Price 2/- and 3/- each

Peptonised Chicken Jelly

(Benger) A pleasant change to the Beef Jelly is provided by Benger's Peptonised Chicken Jelly, made on the same principle and being similarly easy of preparation.

NOTE —Benger's Beef Jelly and Chicken Jelly are entirely free from preservatives

ONE OF THE EARLIEST KNOWN OBJECTS PRODUCED BY THE PIONEERS OF CHINESE AUTOCHTHONOUS ART—The bronzes of the Shang dynasty are the earliest evidence of Chinese artistic impulse They prove that at this time China had reached a considerable degree of civilisation She must therefore have begun her pioneer work much earlier—how much earlier there is nothing as yet to prove People who could produce vessels such as the one here reproduced must have been already long acquainted with the art of making casting and chiselling bronze. The vessels they then began to make they have continued to produce with little variation down the centuries to the present time. These vessels were used in ritual worship of ancestors and were decorated with geometric designs and with motives drawn from nature—chiefly hills clouds dragons unicorns phœnixes and tortoises—but never the human figure The Chinese revelled in the creation of monsters of which the chief and most ancient was the t'ai t'ieh the gluttonous monster who warned against excess in eating and drinking He is conventionalised in the bronze here reproduced as two great—and slanting—eyes These eyes are looked upon by some investigators as a Pacific feature proving ancient contact between China the Pacific Islands and as far as the West coast of America. The Greek key pattern which often occurs should not be taken as evidence of early communication between Greece and China. Such meanders are practically universal in primitive art as are the square the circle and the swastika.

DATE The bronze c. 1750 B C Pioneers were in China probably before 2000 B.C.

EARLY MENTAL DISEASE TREATED IN A GENERAL HOSPITAL

AN ANALYSIS OF FIVE HUNDRED CASES

BY

JOHN D COMRIE, M.A., B.Sc., M.D., F.R.C.P.EDIN.,

SENIOR ASSISTANT PHYSICIAN ROYAL INFIRMARY EDINBURGH PHYSICIAN, DEACONESS HOSPITAL EDINBURGH LATELY CONSULTING PHYSICIAN TO THE FORCES IN NORTH RUSSIA

THE following account gives an analysis of and commentary on one year's work from May, 1923, to May, 1924, in connexion with the wards in the Royal Infirmary of Edinburgh reserved for cases of early mental disease and incidental delirium. A period of fifty-four weeks has been taken to allow for a small number of cases not mentally affected, which were admitted to the wards and which are not included in the analysis for this reason. This has the further advantage of making the number exactly 500, which is convenient for calculating percentages. Of the cases admitted some are sent in by private practitioners for observation, a certain number consist of cases transferred from ordinary medical or surgical wards because of the development of mental changes which render their retention in these wards unsuitable, and a considerable number are brought by the police, or other outside authority, for observation. Many of the cases make a good recovery without incurring the trouble and stigma of certification as insane, but practically all present, on admission, considerable difficulty either in diagnosis or in treatment if it were to be conducted outside an institution. In order of frequency cases fall into the following groups, although it must be understood that this grouping is not suggested as a method of classification:

1. Alcoholic cases 133 (26 per cent.)
2. Melancholia 87 cases (17 per cent.)
3. Confusional states 80 cases (16 per cent.)
4. States of dementia 52 cases (10 per cent.)
5. Psycho-neuroses 35 cases (7 per cent.)
6. Post-epileptic states 29 cases (6 per cent.)
7. Cardiac delirium 22 cases (4 per cent.)
8. Mania, 20 cases (4 per cent.)
9. Gross cerebral lesions 16 cases (3 per cent.)
10. Fixed delusional states 17 cases (3 per cent.)
11. Primary mental defect, 9 cases (2 per cent.)

The general principle followed with regard to disposal of the cases was that patients were put to bed for a period of one or two weeks' rest. By the end of three weeks it was generally quite possible to determine whether the case was likely to recover under treatment so far as to be able to proceed for a period of convalescence in the country or to return home. If the case appeared likely to recover to this extent under hospital conditions treatment was continued, but if at the end of about three weeks no improvement was discernible the patient was, in most cases, passed on to a mental hospital, either after certification, or in some cases as a voluntary admission.

The proportion of cases discharged sufficiently well to return home was 72 per cent. of the total (or, if the alcoholic cases be left out of account, it was 64 per cent.). The proportion of the cases passed on to mental hospitals was 17 per cent. of the total (or, excluding the alcoholic cases from consideration, it was 22 per cent.). Five cases only entered mental hospitals as voluntary patients, but these would probably have been more numerous if this method of disposal had been available for pauper patients. The deaths from all causes amounted to 7 per cent. of the total admissions, including a considerable number of the attempted suicides. Transfers to other (non-mental) hospitals, chiefly a Poor Law hospital, accounted for 3 per cent.

ALCOHOLIC CASES

There were in all, 133 cases definitely due to alcoholic excess. Most of these were brought in by the police as cases of doubtful diagnosis for observation. Of these, 102 cases (74 male and 28 female) were in a stuporous state, in which they continued for periods varying from some hours up to several days. The number of cases of delirium tremens was 14 (13 male, 1 female), and 5 cases were admitted suffering from chronic alcoholic insanity (3 male, 2 female). In cases that showed delusions, the type associated with the Korsakoff syndrome, involving loss of sense of time and place, was very marked. Thus one patient who was able to give a good account of novels he had read, when asked suddenly where he was, gave the name of a public-house, and when asked how he explained the presence of the bed in which he lay, laughingly said he supposed it had been put there to pass away the time. It was found that 26 per cent. of all the cases admitted were directly due to alcoholic excess. It is interesting to compare this figure with the corresponding state ten years ago. In the year 1913, 42 per cent. of the patients admitted suffered from alcoholic excess and the number of cases of delirium tremens was four times as great as in the year now under review. The age of persons suffering from alcoholic excess presents a feature of interest, the average age of the male alcoholics being 47, and that of the women 45 years, while only two men and one woman were under 30 years of age. From the fact that the average age of these persons in 1914, at the commencement of the war, was 37, it is obvious that they could have taken no very active part in the war, and that war conditions have had, therefore, practically no influence in the production of alcoholism, so far as the group of Edinburgh Hospital cases is concerned. Further, excessive drinking among the young would appear to have diminished almost to a vanishing point. In addition to the cases which are directly due to alcoholic excess, the question of alcoholism enters as a partial cause, into the histories of a number of other patients suffering from psycho-neuroses and other mental states so that it would be quite safe to say that alcoholism still enters in some degree into the causation of at least 30 per cent. of all these cases of slight mental deterioration among persons of middle life and over.

Some cases were admitted suffering from the effects of drinking methylated spirit. In general, the resulting intoxication was more violent in effect, but more transitory in duration, than that produced by whisky only. After drinking methylated spirit, excretion by the kidney was very rapid, and clear, almost colourless, urine was passed which in two cases had a specific gravity less than that of distilled water.

MELANCHOLIA AND DEPRESSION

Of the 87 cases admitted for depressed or melancholic states 58 were cases in which suicide had been attempted. The most prevalent method of suicide employed was by cutting the throat (17 cases), lysol came next in order of popularity (13 cases), coal-gas inhalation was responsible for 7 cases, and drowning had been attempted in 6 cases. In considerably smaller numbers the means used were ammonia (3 cases), paraldehyde (3 cases), morphine (2 cases), oxalic acid (1 case), hydrochloric acid (1 case), creosote (1 case), arsenic (1 case), tincture of belladonna (1 case), opening of blood vessels (1 case), and falling in front of a railway train (1 case). Simple melancholia without delusion characterized 75 per cent. of the depressed cases, and it is important to note that most of the attempts at suicide were made by persons suffering from simple melancholia without delusions.

With regard to the cause of melancholia and depression, a bad family history was found in this type of mental disease more frequently than in any other. 26 per cent. of the cases having had from one to four immediate relations definitely insane. In the great majority of the cases it was impossible to attribute the cause to any one factor, a complex, consisting in part of poor physical development, overwork and difficulty of adaptation to surrounding, being usually present. In addition a number of cases showed some definite physical toxic influence which might be regarded as a precipitating cause of the attack for which the patient was admitted. These included a septic condition of the mouth, general alimentary disorder with constipation, thyroid gland disorders, and various preceding febrile conditions. A definite toxic process could be traced in 45 per cent. of these cases, although it was sometimes difficult to say whether the toxic condition should be regarded as the cause or as one of the results of the general physical and mental debility. In 60 per cent. of the cases evidence of

prolonged mental strain arising from the patient's circumstances was elicited—for example, the worry of a drunken husband, of financial conditions, disappointment in some matter upon which the patient had long been counting, loss of relatives, and very frequently idleness consequent upon being out of work. The onset was usually gradual, and in many depressed cases symptoms or recurrences had been noticed for several months or years. The largely temperamental nature of this type of mental disorder was evident from the fact that one-third of the cases were recurrent. Simple melancholia was found to be much commoner in females than in males (85 per cent. and 15 per cent. respectively), but suicide was attempted more frequently in male melancholics (3 males to 2 females). Among the elderly female cases the depression began definitely, in one-third of the cases, in association with the onset of the climacteric. The general plan of treatment included rest in bed, attainment of sleep, if necessary by hypnotics, removal of the toxic or other physical cause, and the provision of light useful work as soon as the patient could take an interest in it. The result of hospital treatment was very satisfactory in melancholic cases, over 60 per cent. being discharged cured, or at least sufficiently well to return home, after about three weeks' detention. Less than 40 per cent. passed on to mental hospitals as more chronic cases.

Confusional States

The 80 cases showing a definite confusional condition included 17 post-operative cases (most of which were associated with sepsis), 4 puerperal cases which were also septic, 16 cases of concussion, 7 nephritics with albuminuria, 13 toxic cases following febrile conditions, especially influenza, 13 cases of pneumonia, 3 cases of diabetes, 2 cases of pernicious anaemia, 1 case of tuberculous kidney, 1 case of haematemesis, 1 case of malignant tumour, 1 case of acute lymphatic leukaemia, and 1 case of pellagra. Most of the confusional cases had delusions of a mild character and very varied type, and 2 cases showed complete transitory loss of memory. Leaving out the cases of concussion, toxic and exhaustive elements were very obvious in the great majority, and such cases were very amenable to treatment, the chief conditions required for treatment being complete rest in bed for a period of two or three weeks, with removal of the septic focus, or treatment of the general septic condition.

No characteristic type of delirium was noted in these conditions, except that in the pneumonia cases, when collapse was impending, the weakness and mental obfuscation produced by the toxic state induced signs resembling those described by Mistress Quickly in the end of Falstaff. "After I saw him fumble with the sheets and play with flowers and smile upon his fingers' ends, I knew there was but one way, for his nose was as sharp as a pen, and 'a babbled of green fields" (*King Henry V*, II, iii, 14). In several other cases associated with cardiac dilatation, the delirium partook of the cardiac type. A patient with pernicious anaemia showed delirium of a very striking character. During the day the patient, who had been doing his work as a railway guard up to two days before admission, was perfectly clear, but every evening he developed a state of wild excitement, imagining that preparations were being made to burn him at the stake, tied to a woman. There were evidently two elements in this complex—one was the element of cardiac excitement, the other, apparently, was some repressed memory stirred up by reflection on the unknown cause of his serious disease. As the anaemia and cardiac dilatation improved the nightly recurrences of the delirium became less terrifying till they disappeared completely.

Cardiac Delirium

Cases with heart lesions who had lapsed into a state of delirium numbered 22. Of these, in 40 per cent. myocarditis with feeble cardiac action was present, in 40 per cent. mitral disease (of which one-half showed auricular fibrillation), and in 20 per cent. aortic incompetence. None of the cases of cardiac delirium was younger than 41, and the average age was 59 years. A correspondence has taken place recently in the BRITISH MEDICAL JOURNAL (July, 1924) as to the type of delirium present in cardiac cases. In my experience the special feature of cardiac delirium is restlessness or excitement, proceeding to anxiety or apprehension in 90 per cent. of the cases—

> "Like one that on a lonesome road
> Doth walk in fear and dread,
> And, having once turned round, walks on
> And turns no more his head,
> Because he knows a frightful fiend
> Doth close behind him tread."

The mechanism appears to be a sense of the necessity for muscular effort, coupled in severe cases with a sense of impending dissolution. The disorientation *as to place*, if present, is merely incidental to restlessness. If the patient imagines himself to be at his place of business this is merely because of the activity and anxiety associated therewith. Another special characteristic of cardiac delirium is that it tends to appear especially towards night, and may pass away completely every morning as the vital tide returns. One patient imagined regularly every evening that "a man with a gun took up his position outside the window" intending to shoot him, and this was associated with great restlessness and anxiety. Another remembered clearly, on the morning of admission, having struggled in the night with his daughter for possession of a knife which he wanted because he thought "his life had to come to an end." Still another was greatly distressed because he had "to rush for the train to business in Edinburgh." The delusion of cardiac delirium thus differs greatly from the delusion of the alcoholic case, which very definitely involves time and place, and is often of a pleasant, sensuous, or amusing nature. The degree of excitement in cardiac cases offers considerable help in assessing the amount of impairment in the function of the heart for the time being.

States of Dementia

This type included 13 cases of adolescence between the ages of 10 and 30 years, in whom the occurrence of such symptoms as katatonia, impulsiveness, bizarre delusions, negativism, and general mental aberration warranted a provisional diagnosis of dementia praecox. A few improved sufficiently to go home, but most of these cases were transferred to mental hospitals. Senile dementia (20 cases) was, in general, associated with arterio-sclerosis and other signs of physical senescence. The most interesting group of cases showing dementia were those associated with syphilitic infection. Two cases of confusion, so profound as to give the impression of dull stupid dementia, occurred at an early stage of this disease, and were presumably due to syphilitic cerebral endarteritis. The mental symptoms in both disappeared after treatment by novarsenobenzol, and these patients became fit to return to their work. These cases are important as showing the great value of early diagnosis and prompt commencement of treatment in patients with cerebral syphilis who are otherwise apt to lapse into permanent dementia. The cases of dementia paralytica numbered 13 (12 men and 1 woman), and the average age of onset was 40 years. All these cases were undiagnosed before admission. The symptoms presented are therefore of interest in regard to diagnosis of general paralysis at an early stage. Only 6 of the cases showed any delusions, and of these 2 only had grandiose ideas. Difficulty of articulation was present in 4 cases. In 2 cases blindness, due to optic atrophy, had existed for several years before mental change supervened. The condition of the reflexes varied much, the knee and ankle jerks being exaggerated in some, absent in others, and in still others exaggerated on one side and diminished on the other. The plantar reflex was extensor or varied from time to time in a few cases, but was flexor in the majority. The signs common to all were failure or diminution of the pupillary reflexes to light, weakness of power of judgement, physical weakness, tremulousness, and strongly positive Wassermann reaction in the blood and cerebro-spinal fluid. The colloidal gold reaction, in those of the cases where it was carried out, conformed to the finding of the Wassermann reaction. All the cases, with one exception, were unaffected by antisyphilitic treatment, and were transferred to mental hospitals. With regard to one case with well marked delusions, who lost all mental symptoms under treatment, the Wassermann reaction in blood and spinal fluid, and the colloidal gold reaction, nevertheless remained strongly positive, although the patient had received 18 grams of novarsenobenzol in six months.

PSYCHO-NEUROSES

This group included 27 cases of hysteria and 8 of neurasthenia With regard to cause definite physical pelvic abnormalities, such as ovarian tumour, uterine prolapse, hysterectomy, etc, were found in 50 per cent of the hysterical cases, thus justifying the ancient Greek name of the condition In this group a previous sexual trauma in the Freudian sense was found to be especially prevalent, and the method of psycho-analysis was more applicable than in any other type of mental aberration In my opinion, however, the employment of this procedure, while very useful in elucidating the vagaries of the patient, is more apt, considered as a therapeutic agent, to be followed by increased mental unrest and distress than by improvement One case in every four had delusions or hallucinations, most commonly of hearing All the cases were improved after an average stay in hospital of three weeks, and one only passed on to a mental hospital as a voluntary patient One neurasthenic was a morphine habitué, and in addition had had laparotomy performed several times, apparently to no purpose This was the only case of drug addiction, which seems to be a much less frequent habit in Scotland than among more southern peoples

POST EPILEPTIC STATES

The number of cases admitted to hospital because of some abnormal state following on epileptic seizure was 29 Of these, 12 per cent were maniacal or homicidal, 25 per cent confused with a tendency to automatic behaviour, 25 per cent had definite delusions 25 per cent were greatly depressed, and 13 per cent, after a period of stupor lasting from a few hours to several days became quite normal The average age of the epileptics treated was 37 years, and one-half of them were mental defectives in a marked degree

MANIA AND MANIC-DEPRESSIVE INSANITY

The number of maniacal cases was 20, of which 3 were recurrent A very close connexion with previous debilitating factors was evident in 80 per cent of the cases These factors included typhoid fever exhausting journeys, the strain of nursing a relative through a long illness, the puerperium, and in a few elderly cases the climacteric The average age of cases was 45 years This type of insanity was not so suitable for treatment in a general hospital as were simple melancholic cases, and, while 40 per cent recovered sufficiently to go home, 60 per cent passed on to mental hospitals

GROSS CEREBRAL LESIONS

These included cerebral thrombosis or embolism (6 cases), cerebral tumour (2 cases), meningitis (3 cases), encephalitis lethargica (4 cases), and lead encephalopathy (1 case) The mental changes in these cases were of the confusional type, passing later into dementia or death

FIXED DELUSIONAL STATES

Cases with fixed delusions numbered 17, including 3 cases diagnosed as paraphrenia and 1 as paranoia These cases, with two exceptions, failed to respond to treatment, and were transferred to mental hospitals after a period of two or three weeks' observation

CONCLUSIONS

1 The chief deduction to be made from this analysis is the great usefulness of a general hospital in treating slighter or undiagnosed cases of mental disorder of these 64 per cent could be treated successfully without transfer to a mental hospital This especially concerned melancholic cases

2 Mental disorder produced by alcohol appears to have greatly decreased and to be confined now chiefly to elderly persons

3 Physical conditions (infective, exhaustive or reflex) as partial causes were discovered in the majority of the cases of melancholia, mania, confusional insanity, and psychoneuroses

4 Types of disorientation and delirium, that are to a considerable degree characteristic, can be recognized in association with different causes of mental disorder

I desire to acknowledge my indebtedness for much help to Dr W McAlister, deputy superintendent of the Royal Edinburgh Mental Hospital to Dr David Slight assistant in the department of psychology, Edinburgh University, and to Dr Helen Young.

THE PATHOLOGY AND SURGICAL TREATMENT OF ANGINA PECTORIS

BY

PROFESSOR DANIELOPOLU,

DIRECTOR OF THE SECOND MEDICAL CLINIC UNIVERSITY OF BUCAREST

I DEFINITION

SOME writers on angina pectoris include under this heading syndromes which have no connexion whatever with the condition Many cardiac diseases are accompanied by precordial symptoms similar to those of angina, but this name should be restricted to a sensori-motor syndrome of the myocardium, sudden in onset, sometimes ending in death, and not depending on dilatation of the heart Acute pulmonary oedema, the angine de poitrine de decubitus of French writers, ought not to be classified as angina, since it is a syndrome arising from an acute dilatation of the left ventricle, it should be included in the asystole group A fundamental difference exists, moreover between angina pectoris and the phenomena of cardiac dilatation, anginal attacks only occurring when the myocardium is healthy and acting well, they diminish or disappear as soon as the heart becomes weak and dilated Aortic pain must similarly be removed from the category of angina, since this condition results from the distension of a diseased aorta by a sudden increase of intra aortic pressure The precordial pain in this case is like that of angina, and the aortic distension necessarily gives rise also to cardio-vascular reflexes, but the condition is related exclusively to the aorta, and is probably never the cause of death An additional difficulty in distinguishing clinically between angina and aortic disease is that the same factor—for example sudden exertion—may bring on at the same time two phenomena the anginal spasm referable to the myocardium and aortic pain originating in the aortic wall But when the mechanism of their production is considered a sharp distinction must be drawn between these two pain syndromes, and it must be emphatically denied that an attack of angina pectoris can ever be produced by aortic distension

II PATHOLOGY

I cannot give assent to the aortic hypothesis put forward by Clifford Allbutt Smith, Wenckebach and Vaquez, according to which angina pectoris is exclusively due to aortic distension It is impossible to imagine such a distension occurring without there being an increase in the intra-aortic pressure, and yet those very writers who uphold the theory of aortitis admit that the blood pressure is not invariably increased during an anginal attack Then, again, it is difficult to account for the occurrence of death if there is nothing more than a simple distension of the aorta The reflex inhibition due to stimulation of the vagus, which Clifford Allbutt cites as the cause of death, ought to be accompanied more often by cardiac phenomena referable to the parasympathetic system, in particular by slowing of the heart beat Yet very often the beat is quickened during an attack and death supervenes on a condition of marked tachycardia or arrhythmia Mackenzie suggests as the cause the onset of myocardial exhaustion but in none of his publications apparently does he distinguish between this condition and that which other writers recognize as myocardial insufficiency leading to dilatation Opposed to this hypothesis of Mackenzie is the fact that in the anginal patient his attacks occur only while the myocardium is acting well so soon as it becomes weak, and dilatation occurs the attacks diminish and cease Coronary disease can no longer be advanced as a hypothetical cause of angina pectoris Cases of disease of the coronary arteries without anginal symptoms are known to occur and also cases of angina pectoris in the absence of coronary disease It appears advisable, therefore, to replace the anatomical idea of coronary disease by the physiological conception of an inadequate coronary circulation Angina pectoris cannot be described as an inflammation of the coronary arteries, since either may exist in the absence of the other It is possible, however, to say that all angina pectoris is the result of an inadequate coronary circulation, which may occur when

the arteries are healthy, but is more likely when they are in a state of sclerosis This suggestion will account for the frequency of coronary disease in angina, anginal symptoms may, nevertheless, originate in a heart in which the coronary arteries are healthy, or be absent even when there is extensive sclerotic change

The explanation appears to be as follows The anginal attack arises from a disturbance of the balance between the work of the myocardium and its blood supply through the coronary arteries This disturbance may occur in the case of a healthy heart, but is more common if the coronary arteries are somewhat obstructed It is conceivable that even healthy coronary arteries, faced by an excessive demand, may be unable to respond sufficiently to provide an adequate myocardial blood supply, and consequently it is not out of the question that such a disturbance of balance may occur in a perfectly healthy heart In this way can be explained anginal attacks occurring in young subjects following the rapid ascent of a mountain, or after cycling, or some other strained effort, when no coronary

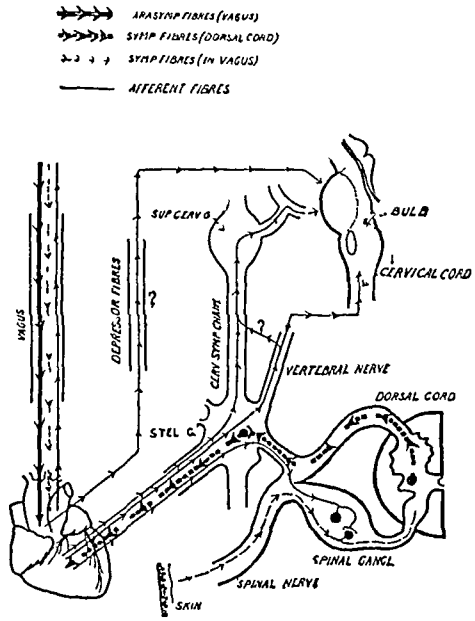

FIG 1—Efferent and afferent cardio aortic nerves in man The greater number of the accelerator fibres travel through the stellate ganglion and the inferior cervical ganglion a small number pass by the vagus *Moderator* fibres (parasympathetic) are present in the vagus and sympathetic and parasympathetic fibres make up the efferent cardio aortic nerves The afferent (sensory) nerves are composed of the ascending and lateral groups The path of the ascending group is not finally established but it is thought that its fibres are scattered in the cervical sympathetic and its cardiac branches in the vertebral nerve in the vagus and its cardiac branches and in the nerve of Hofer It is necessary to cut as many of these sensory nerves as possible in angina It is proposed therefore to divide the cervical sympathetic above the inferior cervical ganglion, the branches which leaving the cervical sympathetic cord run towards the neck and also the nerve of Hofer when present The ascending group contains two groups of fibres which are named pressor and depressor, according to their relationship with the cardiac and vascular centres and in accordance with the results obtained by stimulating their central ends It is not established which nerves of the cervical region contain the pressor fibres and which the depressor fibres but in view of the fact that the reflexes which appear in angina are mainly pressor in type it is the more necessary that all the ascending sensory fibres should be cut A note of interrogation has been introduced into the diagram at the side of the depressor fibres not to indicate doubt as to their existence but because it is just possible that there exists a separate nerve exclusively depressor The lateral group consists of fibres which traverse both the stellate and the inferior cervical ganglia and travel in the posterior roots Their trophic centre is placed in the spinal ganglion and they meet here (or in the cord, according to some writers) with the sensory cutaneous fibres

disease was found at the necropsy Moreover, this suggestion explains those cases of coronary disease without anginal symptoms, where the slowness of growth of obstruction in the coronary arteries has permitted the development of anastomotic channels, and the provision of a good blood supply When an anginal attack occurs in a healthy heart after overexertion, there is present a condition of coronary insufficiency without coronary disease, in the case of extensive coronary obstruction without anginal attacks there is present coronary disease without coronary insufficiency Furthermore, in cases of angina without coronary disease, but with subsigmoid aortitis only, the coronary orifice is often involved Even when this is not so the loss of aortic elasticity leads to interference with the free functioning of the coronary orifice during systole Whilst the hypothesis of coronary inflammation only explains a single class of cases, that of coronary insufficiency is applicable to all When an anginal attack is precipitated by strain the failure of adjustment between the work to be done by the heart and the cardiac vascular supply is brought about by the increase in the work of the heart (quickened action with or without increase of arterial blood pressure) associated with an unaltered coronary circulation When the attack comes on during rest the loss of balance is the result of a sharp diminution in the blood supply (brought about by coronary spasm), the heart's action remaining unchanged

What, then, is the nature of the process which results in anginal attacks? I believe that the starting-point of angina is in the myocardium more precisely in the left side of the heart, and I suggest that the process is analogous to that which is concerned in the fatigue of voluntary muscle If a voluntary muscle is to continue working without ever tiring, its blood supply must be sufficiently good to remove all the toxic products of activity If the blood supply is inadequate (as in the case of an increase in muscular work associated with an unchanged vascular supply, or, again, a decrease in the blood supply with no change in the work), the muscle after each contraction is incompletely emptied of the resulting toxic substances The consequent intoxication produces muscle

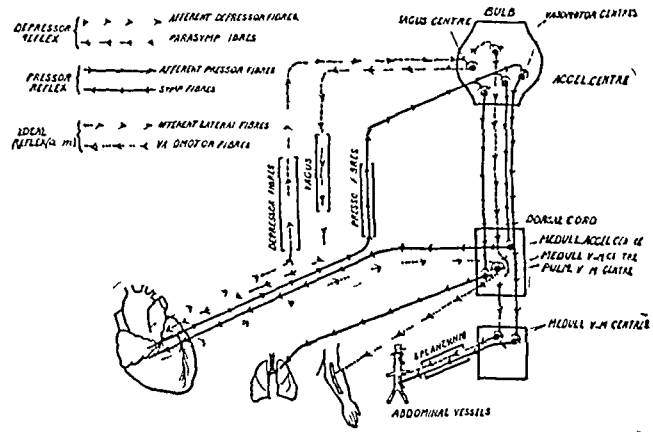

FIG 2—Plan of the pressor and depressor reflexes Stimulation of the sensory nerve endings in the heart and aorta gives rise to two kinds of vascular reflexes—general and local The general reflexes are of two kinds—depressor and pressor The depressor reflex slows the heart and diminishes the force of its contraction by stimulating the nucleus of the vagus it lowers the blood pressure by stimulating the vaso dilator centre and bringing about abdominal vaso dilatation The pressor reflex quickens the heart and increases the force of its contraction by stimulating the accelerator centres it raises the blood pressure by stimulating the vaso constrictor centres, producing a vaso constriction especially in the abdomen In angina the pressor reflexes predominate the more important local vascular reflexes are those which occur in connexion with the vessels of the arms, and especially of the left arm

fatigue, evidenced by sensory symptoms (feelings of fatigue and pain) and motor symptoms (temporary paralysis) The sensory symptoms are due to the stimulation of sensory nerve endings, the motor to changes in the motor nerve endings, brought about by toxic substances accumulating in the muscle It is likely that an analogous condition exists in the case of the anginal spasm The inadequacy of the coronary blood supply, arising from one or other of the contingencies just mentioned, leads to myocardial poisoning and cardiac fatigue by a process analogous to that admittedly obtaining in the case of voluntary muscle From this there result sensory symptoms (distress and anginal pain), and also motor phenomena (tachycardia, extra-systoles, alternating beats, etc), which may end in the heart ceasing to beat The former are due to the stimulation of sensory nerve endings in the myocardium, the latter to a change in the motor endings, which are very much more complex in the myocardium than in voluntary muscle, because of the presence of nerve ganglia in the heart muscle

The sensory nerves of the heart and aorta play an important part in the development of anginal attacks The depressor nerve is not usually taken into consideration as being one of these nerves, which is a great mistake.

Depressor fibres make up only a small part of the nerve tracts passing to these organs These nerve tracts are numerous, but their exact course in man has not been finally determined Several experiments on animals and some tentative surgery in the case of anginal patients support the following explanation, which will undergo radical modification later on with greater knowledge of anatomy and physiology

Two groups of sensory fibres appear to exist, termed, in accordance with their direction the "ascending" and the "lateral" group (Fig 1) The ascending group is composed of fibres which travel upwards in various cervical nerves—the sympathetic chain the vertebral nerve, and the vagus Occasionally, moreover, a special nerve passes out of the thorax to end in the trunk of the vagus and the superior laryngeal nerve this has been named the 'depressor nerve" by Hofer, who has not however, produced proof of its nature It is also quite likely that some sensory nerve fibres of the heart and aorta travel in the cardiac nerves, which leave the cervical part of the sympathetic chain and the vagus nerve The lateral group consists of fibres travelling in the rami communicantes, which unite the first thoracic and the last cervical ganglia with spinal nerves (eighth cervical and the four upper dorsal) and reach the corresponding spinal ganglia through the posterior roots of those pairs of nerves According to some writers these fibres terminate in the spinal ganglia, according to others they enter the cord becoming associated with the neurone of cutaneous sensation Thus after a certain point, visceral sensation has no separate path of its own, but is conducted by the channels of cutaneous sensation In health the cardio-aortic sensory nerves conduct reflexes only in conditions of disease, such as in angina pectoris in addition to these reflexes, the stimuli give rise to anginal symptoms—pain spasm, palpitation, etc

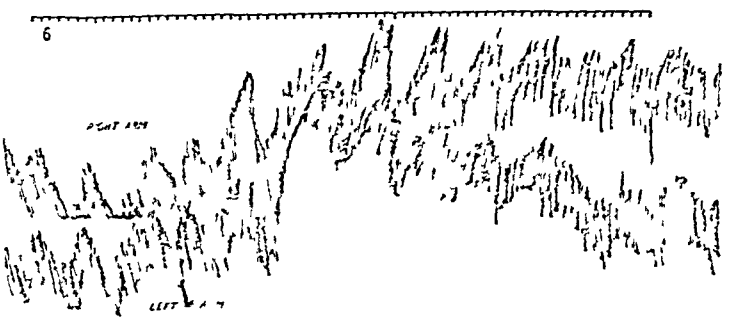

FIG 3—Plethysmograph tracings of the right arm and of the left arm taken during an anginal attack in a patient who had had very many such attacks The vasomotor oscillations are much more marked in the left than in the right arm

The most important reflexes which arise in the heart and aorta in the case of an anginal attack are the vascular ones—the general reflexes are depressor and pressor Depressor reflexes arise in connexion with the sensory depressor nerve fibres, which in man take the place of the nerve of Cyon, the bulb, and, as a centrifugal path, the parasympathetic The pressor reflexes find their way along the numerous sensory pressor fibres in the cervical nerves the bulb and, as a centrifugal path, the sympathetic The depressor group slows the heart, diminishes the force of myocardial contractions, and lowers the arterial tension, whilst the pressor group accelerates the heart strengthens its contraction and raises the arterial tension (Fig 2) Various physiological experiments have shown that visceral stimuli unleash at once two antagonistic kinds of reflexes—pressor and depressor—but that sometimes the depressor effects (parasympathetic) predominate sometimes the pressor effects (sympathetic) This rule has been frequently established in the case of the sympathetic nervous system The increase of arterial tension, as also the quickened heart beat which often accompany an anginal attack, lead to the belief that during the anginal attack the pressor reflex is predominant With reference to local reflexes during anginal attacks, the plethysmograph has brought to light marked vasomotor oscillations in the arms, particularly in the left arm (Fig 3), and an increased sensitiveness of the vessels of the left side to such drugs as amyl nitrite (Fig 4), which act on blood vessels Furthermore Mackenzie describes contractions of pectoral muscles, which he classes as a 'visceromotor reflex," but which would be better termed a "visceromyotonic reflex" Although general reflexes travel mainly along the ascending tract, these local reflexes pass in the lateral tract

Apart from the reflexes the sensory nerves carry the anginal sensation, particularly pain, and the feeling of anguish The pain is referred to the skin, and can only be conducted along those sensory visceral filaments which are in anatomical relationship with the sensory cutaneous fibres In man it is primarily the lateral group which enters the thoracic cord but recollecting that stimulation of the central end of the nerve of Cyon produces pain it must be inferred that there exist also ascending fibres which can conduct pain sensations, and which are to be found with the depressor and pressor fibrils in the nerves of the cervical region These pain fibrils must come in connexion with the cervical cord, which perhaps explains the occurrence of pain in the neck and jaw With regard to *the feeling of anguish, the palpitation, and sense of* oppression which sometimes accompany it, these have been shown to be felt in the heart itself and to be transmitted along the ascending tracts Vascular reflexes play an important part in the production of angina pectoris The surgical investigations of Coffey and Brown of Eppinger and Hofer have shown that section of the sensory ascending filaments (which, according to the first two authorities, pass by the chain of the sympathetic, and according to the latter, by a separate nerve) prevents anginal attacks from occurring From these facts very important conclusions are deducible with reference to the pathogenesis of angina These results, which have the value attachable to actual physiological experiments, show that the cutting of these nerve fibres which have no anatomical connexion with the skin areas to which the anginal pain is referred (chest, back left arm) prevents an anginal attack from occurring With this knowledge to guide us the following may be set out as the explanation or the development of an anginal attack

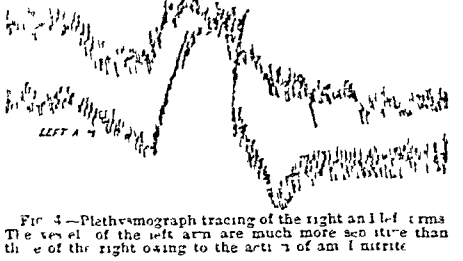

FIG 4—Plethysmograph tracing of the right and left arms The vessels of the left arm are much more sensitive than those of the right owing to the action of amyl nitrite

After the disturbance of the balance between the work of the heart and the coronary circulation there develops as described above, an actual poisoning of the myocardium Toxic substances accumulate and irritate the sensory nerve fibres in the myocardium So long as the irritation is feeble no pain results, but only reflexes which undoubtedly pass along the two classes of nerve fibres pressor and depressor The fact that during an anginal attack the heart's action is usually quickened and the blood tension raised proves that it is the pressor reflexes which are predominating This class of reflex can only intensify the myocardial poisoning for it increases the work of the heart A vicious circle is thus set up which stimulates increasingly the sensory nerve endings in the heart when the stimulation is sufficiently acute, pain makes its appearance Motor phenomena also appear (irregularities of beat stopping of the heart), which are due to changes in the motor elements in the myocardium To prevent the

formation of this vicious circle it would be necessary to close those sensory channels which conduct the reflexes, and this matter is dealt with later

III WHY ANGINAL PAIN SPREADS MAINLY OVER THE LEFT SIDE

The fine research work of Mackenzie on the anatomical relationship of the visceral and cutaneous nerve fibres affords an explanation of the reference of anginal pain to the skin But this relationship exists on the right side as on the left Why, then, does the spread of pain occur mainly over the left side? The explanation is that in angina the sensory nerves on the left side are more strongly stimulated With regard to the centrifugal fibres (sympathetic and parasympathetic), it is known that the nerves on the left side pass to the left cavities, the nerves on the right to the right cavities A similar arrangement must exist for the sensory nerves The anginal pain is located mainly in the left side, and radiates over it because the cavities of the left side are being compelled to perform an excessive amount of work during the attack It is the left ventricle, moreover, which shows the most extensive coronary lesions, and so the sensory nerve endings in the myocardium are rendered hypersensitive

IV SURGICAL TREATMENT OF ANGINA PECTORIS

The surgical treatment of this condition has had hitherto a "bad press" because it has for the most part been employed empirically Moreover, our ignorance of the precise path of the cardio-aortic sensory nerve fibres, and of the part they play in angina, prevents us from doing more than theorize There are, however, some well established physiological data which must be taken into account when considering the surgical treatment of angina It is known, for example, as a definite fact that the synapse of nearly all the sympathetic nerve fibres of the heart is situated in the stellate ganglion We must therefore consider the results of removing this ganglion in a patient suffering from angina, whose myocardium is the site of extensive lesions, and whose left ventricle is being subjected to heavy work owing to the arterial hypertension accompanying this condition Here will be found the explanation of many of the fatalities following extirpation of these ganglia in the operation of cervico-thoracic sympathectomy practised by T Jonnesco, who, in his published reports, shows that this operation has been followed by death in three out of six cases Another fatal case occurred recently, and Hofer in Vienna has reported a fifth, bringing the death rate to over 60 per cent Death results, as I have shown in previous publications, from failure of the left ventricle, and, above all, from acute pulmonary oedema, Cervico-thoracic sympathectomy has been disastrous from the therapeutic point of view, but it has at any rate made it clear that removal of the stellate ganglion in angina is incompatible with life

This operation must, then, be definitely abandoned, but the idea of surgical treatment of angina need not be given up, there is, indeed, reason to believe that it is the right line I have suggested section of the cervical sympathetic chain Coffey and Brown have practised this operation below the superior cervical ganglion combined with section of the first cardiac sympathetic nerve, and some benefit has resulted therefrom Eppinger and Hofer have cut a nerve which takes its anatomical origin by two roots, one from the vagus, the other from the superior laryngeal nerve, and which passes towards the thorax They term this a depressor nerve, but the physiological tests, which alone can establish such an implied function, are omitted from their investigations On the contrary, the very definite improvement obtained in their cases by no means indeed be likely that the closing nerve, and it would constituted by the depressor nerve, of the safety-valve, coronal attacks by increasing the would aggravate the angina probable that this work of the heart It appears that and that nerve contains a certain number of pressor fibres, only thus can there be an explanation of the benefit brought about in angina by the method of Eppinger and Hofer In another quarter Stoechelin and Hotz have had good results from cutting the first cardiac branch of the vagus.

So it appears that the section of quite different nerves brings about the same result—namely, a distinct improvement in angina pectoris This proves three things (1) that all these nerves contain sensory cardiac nerve fibres, (2) that cutting some of the ascending fibres, without putting them all out of action, is sufficient benefit anginæ, (3) that the abolition of the ascending nerve fibres, having no possible relationship with the latter group, which alone explains the localization of the pain, can, nevertheless, prevent the occurrence of the pain syndrome of angina These are the facts which suggest that there should be assigned to the ascending sensory group an important part in the originating of the anginal spasm, the reflexes, particularly of the pressor type, which they conduct, set up a vicious circle, which increases the irritation of the sensory nerve endings, giving rise eventually to pain It is this vicious circle that must be prevented from developing, and this can only be done by cutting the ascending sensory nerve fibres through which the pressor reflex is produced The primary factor is still operative, but the pressor reflexes being no longer produced, the sensory and the motor phenomena are scarcely apparent, and do not reach the point of causing pain, cardiac irregularity, or cessation of the heart action Unfortunately, however, the ascending sensory fibres, pressor and depressor, are scattered through the nerves of the cervical region Physiological experiments and operation results show that they are present in the cervical part of the sympathetic chain, the vertebral nerve, in the so-called depressor nerve of Hofer, in the vagus, including, perhaps, its cardiac branches, and in the cervical cardiac branches of the sympathetic There is only one neighbourhood where they can be easily reached—the inferior cervical and first thoracic ganglia, through which pass nearly all the sensory nerve tracts of the heart and aorta Experience has proved that in angina it is impossible to touch these ganglia without risk of killing the patient Coffey and Brown, Eppinger and Hofer, Stoechelin and Hotz, have performed an admittedly incomplete section of the ascending fibres from which some improvement resulted, but is this benefit permanent? It is true that most definite results were obtained by cutting the nerve of Hofer, but in one case the anginal attacks were only decreased in intensity, and in another the attacks returned after a few months This shows that the operation may be inadequate, which may be attributed to the fact that too small a number of sensory nerve fibres were cut It is necessary to sever as many as possible of these ascending fibres, and such an operation is quite practicable Of all the nerves which may contain these fibrils the vagus is the only one which must not be touched The cervical sympathetic chain and the vertebral nerve can be cut above the inferior ganglion without any danger The few cardiac accelerator fibres in the vertebral nerve, which come from the cervical cord, are of little importance compared with the large group of fibrils which leave the thoracic cord and pass through the stellate ganglion Similarly, there is no danger in cutting the nerves which emerge from the cervical sympathetic cord above the inferior cervical ganglion and pass to the heart, containing perhaps some sensory fibres It is further necessary to cut the special nerve described by Hofer, if present, which arises from the vagus and superior laryngeal nerve jointly and travels into the thorax

To sum up, it is suggested that in angina pectoris there should be cut the cervical sympathetic cord, and the vertebral nerve above the inferior cervical ganglion, the nerve of Hofer, or any corresponding nerves present, and the nerves which spring from the cervical sympathetic cord above the superior cervical ganglion and pass to the heart Thus, whilst preserving the important centrifugal nerves which are essential to the action of the heart, we are cutting the greater number of ascending sensory fibres to which is assigned an important part in the launching of the anginal attack Only by this operation as detailed above can permanent benefit be obtained The lateral sensory group which enters the thoracic cord is certainly left intact, but, as previously shown, this group is of only secondary importance Since the principal site of the anginal attack is the left side of the heart, and it is the sensory nerves of the left side which are mainly affected, the operation must be

performed on the left side in the first place Is it necessary to complete it on the right side? It would be difficult to give any categorical answer, but it is more than likely that in the majority of cases the operation on the left side would be sufficient None of the surgical methods suggested can yet be considered the ideal, it is certain that cervico-thoracic sympathectomy must be absolutely abandoned, whilst each of the other methods has as yet done no more than establish a right to be considered in therapeutics In the present state of our knowledge regarding the innervation of the heart and aorta in man it is only possible to outline a hypothesis, but research is proceeding It is unnecessary to add that the hypothesis can be modified or even abandoned in the face of fresh facts if they show that it is faulty, but at the present moment the line of reasoning set out above is the only one that seems legitimate

PROLONGED REST IN THE HORIZONTAL POSITION A FERTILE CAUSE OF PUERPERAL SEPSIS

BY

HENRY CORBY, M D , M Ch ,

PROFESSOR OF OBSTETRICS AND GYNAECOLOGY, UNIVERSITY COLLEGE CORK

In the BRITISH MEDICAL JOURNAL of August 16th I read a leading article on ante-natal care in private practice, in which the following statement occurs "Indeed, it is only too true that with the exception of the advances rendered possible by the advent of anaesthesia and of Listerism (chiefly in Caesarean section) there has been little progress in obstetrics during the last fifty years" This is a very strong indictment with regard to an important branch of medical science But with regard to the preventive treatment of puerperal sepsis I am afraid it is only the absolute truth No doubt antiseptics have proved to be excellent preventives, the records of the New York Maternity Hospital showing that since their introduction in that institution the mortality from puerperal sepsis has been reduced to nearly one fifth of what it had been previously But much still remains to be done to save innumerable valuable lives Two things struck me forcibly when I was one of the visiting physicians to the Cork Maternity One was the thorough contempt the patients in the lanes exhibited for the teachings of medical science with regard to the amount of rest that should be taken after a confinement The other important fact was that puerperal sepsis was almost unknown among these women, though they lived in the midst of squalid poverty and in surroundings which were the reverse of sanitary Since then, many times I have asked myself whether it may not have been a case of cause and effect Did the early sitting up indulged in by these patients and their rising from bed at an early date to do their work all tend to prevent lodgement of the lochia in the uterus and vagina, and thus render them less susceptible to sepsis? When I was a student the teaching would almost imply absolute immobility in bed for the puerperal woman Now things are more liberal, as it is considered quite orthodox for the patient to sit up when micturating But I see one modern author would not allow his patients to leave their beds till between the tenth and fourteenth days whilst others would keep them lying down till the eighteenth day Whether this lengthened rest is necessary, or on the other hand injurious, is a problem still awaiting solution

As I was anxious to know whether the poor in the slums of the city were still adopting the same methods as they did when I was a visiting physician to the Maternity, I questioned the present matron, who is a trained obstetric nurse, and as such had a good practice of her own prior to obtaining her present appointment nearly ten years ago I elicited from her some very interesting and important information She tells me that the average time extern patients remain in bed is four or five days and she gave me the history of sixteen of these patients who were still under the care of the nurses when she was speaking to me Five of them remained in bed till the fifth day only, but the other eleven considered that time too long and they got up the third day On the third day when the nurses called to attend the eleven they found one of them washing a tub of clothes, another was scrubbing the floor, and another was gone to town, probably to bring home the marketing And yet amongst the extern patients there was only one case of sepsis during the nearly ten years the matron has been connected with the Maternity On the other hand, within the same period amongst the intern patients, who are much fewer in number, there were three cases of puerperal sepsis All three were halt sitting up during micturition and defaecation One of the three sat up fully the third and every day afterwards, and she recovered The other two did not sit up fully any day, and both died Had the prone position nothing to say to the development and continuation of the sepsis in these cases? I will have more to say on the subject presently but here I may mention that some years ago in a work on midwifery I read that the author had a case of puerperal sepsis and the patient, contrary to his instructions, got out to the night-chair, and within a very short time there was quite a considerable drop in the temperature, probably due to the drainage of the uterus

Before considering whether sitting up in bed at stated intervals may be an advantage or disadvantage for the puerperal patient, and before discussing whether prolonged rest may or may not be beneficial, we had better first study Nature's methods of defending the organism against bacterial invasion First of all we have the vaginal bacillus, an efficient sentinel ready to attack any pathogenic bacteria that may have gained entrance through the ostium vaginae But it is during labour that the most energetic forces are brought into play At the end of the first stage the rush of the liquor amnii tends to flush out all bacteria that may be present During the second stage the downward passage of the child's body tends to firmly brush them out The expulsion of the secundines produces a similar result, and then the after bleeding helps to complete the work

Here, now, are some of the arguments that have been used against getting the patient at stated times to sit up in bed and against her rising early We are told that she might get pulmonary embolism But it is now asserted that pulmonary embolism except in the presence of some complication such as sepsis, cannot occur later than six or eight hours after labour Be that so or not, much would depend on the suddenness with which the alteration in position had been made Again, though undoubtedly a formidable complaint, at least here in Cork it is of very unusual occurrence I can recollect seeing only two cases One died within about ten minutes, as a matter of fact I did not actually see her in the attack at all The other was alcoholically inclined, and when I was resuscitating the child she suddenly sat up in bed and said we were paying all attention to the child and none to her The attack came on at once, but she recovered, and I remember part of the treatment was the application of leeches to the precordium

Another argument which has been used is that owing to the supporting ligaments of the uterus being soft and their lengthening remaining and also owing to the uterus being heavy prior to involution taking place, prolapse would be likely to occur I must own that even after starting this paper that seemed a puzzle for me, but I reflected that if things were as represented any number of the denizens of the lanes of the city should be victims of prolapsus uteri, and I asked myself, are the poorer women attending the gynaecological department of the Maternity more frequently suffering from this complication than the well-to-do patients coming to my study? I must say in this regard that I am inclined to think there is very little difference between these two classes of women If the puerperal woman were left to her own devices surely she would wholly or partially sit up when micturating or giving the breast to the child, and I asked myself, Could Dame Nature, so careful in other respects, be so negligent or the puerperal patient as constantly to subject her to the risk of becoming a chronic invalid solely because she had fulfilled the high function of propagating the species? Further thinking led me to a solution of the problem Here it is the first day of the puerperium the walls of the uterus are nearly two

inches thick, and the fundus is five inches above the symphysis pubis Consequently at this time we are dealing with a very bulky organ which is resting on the false pelvis and on the brim of the true pelvis Even on the ninth day, the day on which many ladies get up, it is so comparatively large that the fundus is still an inch above the symphysis, and even when the uterus becomes a pelvic organ it must for some time be getting surrounding support Clearly, then, during a very great part of the puerperal period there is no need for the suspensory ligaments to exercise their normal functions, and they can well afford to wait till they will have contracted sufficiently to enable them to do their work efficiently

So after all Dame Nature is not the blind goddess some obstetricians would represent her to be, and I am afraid that we must dismiss as a figment of the imagination the oft-repeated statement that much sitting up in bed or the early rising of the puerperal woman gravely endangers her suffering from uterine prolapse

In this connexion I may point out that it is known that certain uterine displacements are prolific causes of abortions, and if early sitting up in bed and early rising during the puerperium readily lend themselves to the production of these displacements, then we ought to have any number of abortions amongst the extern patients of the Cork Maternity But what are the facts? Statistics indicate that something like 10 to 20 per cent of all pregnancies terminate in abortions, and yet the records of the Maternity show that amongst the extern cases attended the number of abortions was a little less than 3 per cent of the pregnancies I recently questioned a gentleman who had been a prominent Government official in the Transvaal, as to the habits of Kafir women with regard to their confinements, and he told me that after the confinement they would be out working hard that very day in the fields, and he added that Kafir women are a healthy race In answer to further inquiries, he said he never heard of a Kafir woman having puerperal fever, but he had heard of Europeans suffering from the disease

I have now mentioned some facts that would tend to indicate that women who rise, perhaps, in some instances, too soon are less liable to be attacked by sepsis than women who remain lying down for a considerable time, and I think we might with advantage investigate this subject further Judging from the energetic measures taken by Nature during and soon after labour to get rid of any noxious bacteria that may have found entrance into the genital tract, we may assume that an important function of the lochia is to wash out any debris that may have remained in the uterus after labour is ended, and we know that a piece of the membranes might be left behind unnoticed and, even though small, large enough to form pabulum for a whole colony of bacteria and a suitable nidus from which they could lay siege to the adjoining tissues It would be almost an insult to intelligence to ask whether the bit of membrane would be more readily removed by the lochia when the patient is sitting up or in the prone position Another function of the lochia is to flood out any pathogenic bacteria which may have gained entrance into the vagina or uterus, and the same remarks with regard to position apply to this But that is not all The dorsal decubitus causes the lochia to stagnate in pools in both the uterus and vagina thus forming veritable forcing beds for the breeding of noxious bacteria Furthermore, the lochia retained in the uterus, acting as a foreign body, interferes with adequate involution, leaving the cavity larger with freer entrance for the bacteria, owing to this subinvolution the uterine vessels and lymphatics are not adequately compressed by the muscular fibres, and the bacteria or their toxins can all the more readily get into the general circulation Once puerperal sepsis develops this state of affairs tends to accentuate matters For some years past I have been instructing my patients to sit up at stated intervals in bed, with, as I believe, good practical results

Out of the mouths of babes comes wisdom, and poor women residing in the slums of Cork, who through force of circumstances felt compelled to ignore medical advice, have taught me what I consider a very valuable lesson

DISCUSSION ON DYSMENORRHOEA IN YOUNG WOMEN ITS INCIDENCE, PREVENTION, AND TREATMENT

OPENING PAPERS

I —ALICE E SANDERSON CLOW, B Sc, M D, B S, Cheltenham

"DYSMENORRHOEA" is a word to which so many definitions have been given that it is necessary to state in what sense one is using the term This entails an understanding as to what we mean by "normal menstruation" Experience has taught me that menstruation is a function which, when normal, has no symptoms If there were not external evidence of it a large proportion of women would not know when it was taking place This is the normal state of affairs Suffering of any kind associated with the menstrual period is abnormal, and is included in the meaning of the word "dysmenorrhoea" as used in this paper

INCIDENCE

In support of the above statement with regard to normal menstruation I have obtained, during the last eleven years, the following figures, as the result of questioning over 2,000 healthy girls whose ages range approximately from 12 to 22 years The information was elicited at the first interview after the onset of the catamenia Of these girls, 1,830 were at a secondary school (in which the majority of the pupils were boarders), and were seen in the course of the annual medical inspection, the remaining 220 were students at a training college for teachers, at which I have been one of the medical officers for the last five years

Having decided from the first that there can be only one line of demarcation between normal menstruation and dysmenorrhoea, I divided the cases into two main groups In the first group (normal) I put those who stated that they had no pain or discomfort whatever during the period, or as they usually expressed it, "felt just ordinary", also those who had, on very rare occasions, experienced some discomfort In the second group (dysmenorrhoea) I placed all those who owned to any pain, however slight, or any feeling of malaise, such as headache or nausea, associated as a general rule with the menstrual period This group I further subdivided under three headings according as the symptoms were "slight," "subacute," or "disabling"

The result was as follows

Number of girls questioned, 2,050			78%
Group I	Normal	17%	
Group II	Dysmenorrhoea—	2%	22%
	Slight	3%	
	Subacute		
	Disabling		

Of the type of dysmenorrhoea known as "spasmodic" I have only recorded five cases It is remarkable how rare it is for any pain or discomfort to be experienced during the first two or three menstrual periods Only three girls stated that this was the case

The percentage of cases of dysmenorrhoea from my own investigations is much lower than that obtained from schoolgirls by the two observers quoted by Dr Blair Bell at the Congress of Obstetrics and Gynaecology last year These figures (53 and 42 per cent) were obtained from 268 and 500 girls by Dr Mario Jacobi and Dr Catherine Chisholm respectively

Now the figure I obtained with the first 734 girls interviewed, as recorded below, was 46 7 per cent, which is about midway between the two percentages quoted above

The reason for the marked reduction in my total numbers will be apparent later Suffice it to say now that with the change in the school regimen with regard to exercise there has been a steady decrease in the incidence of dysmenorrhoea, even among those questioned on the subject for the first time Also the average age of entrance to the school has been considerably lower during the last five years, so that the influence of the school customs with regard to the menstrual period starts, in many cases, at puberty

I hope it may soon be recognized that it is quite unnecessary for as many as 22 per cent of schoolgirls to be subject to a monthly recurrence of pain or discomfort A study of the textbooks on gynaecology would certainly not lead one to the conclusion that menstruation is normally a painless process I have not found one which does not give the impression that suffering must be expected to occur during the menstrual period

It is difficult to see how gynaecological surgeons can acquire a first-hand knowledge of the normal menstrual process, when their time is occupied in dealing with pathological conditions I would suggest that the only reliable statistics on the menstrual function can be obtained by medical women who have access to a large number of healthy girls and women in schools and colleges and industrial institutions The importance of right teaching on the subject to medical students can hardly be overestimated, because on it depends the advice given to the mothers of the next generation So long as the family doctor teaches that the menstrual period should be regarded as a time of semi invalidism, so long will dysmenorrhoea continue to be a common complaint

I notice that some gynaecologists do not consider menstrual pain worthy of the name of dysmenorrhoea, nor of treatment, unless it is so severe that a woman is incapacitated thereby It is agreed by all that the disabling forms are rare compared with the less serious types of the complaint The latter, therefore, are of greater importance from the national and industrial point of view Surely any pain or discomfort endured during working hours must detract from the value of the work done, therefore apart from any desire to alleviate the suffering of the individual, it is important that dysmenorrhoea, however slight should not be disregarded, but should be cured if possible

PREVENTION

Since my girlhood I have known that normal menstruation is a painless function, and that not only can baths and exercise be continued with impunity throughout the normal period, but that dysmenorrhoea is usually thereby relieved, if not dispelled

During my first year of medical inspection at the school which supplies me with my data, the rule, as in other boarding schools, was that games and gymnastics and baths were discontinued during the first three days of the period Those who felt so inclined were allowed to go out for a walk, the alternative form of recreation was to lie down and read a novel In some of the boarding houses the latter became the more popular procedure, with the result that an increasing number of girls did not feel well enough to continue the ordinary routine of school life In many instances girls were kept in bed one or two days during menstruation, at the request of the parent or home doctor This still occurs in a few cases I was quite sure that these practices not only incurred a waste of time but were a source of future preventable suffering I therefore questioned each girl, who had arrived at the age of puberty, as to her feelings and habits at the menstrual period and explained my views with regard to the hygiene of the period, instructing her to obtain consent from home before putting my advice into practice The advice given corresponds with that recommended by the Council of the Medical Officers of Schools Association, which has been issued in leaflet form for distribution by headmistresses It is as follows

Advice to Girls concerning the Monthly Period *

1 The monthly period is not a malady but a natural function you ought therefore, at these times to feel quite well and to be free from pain or any unpleasant sensations

2. The ordinary rules of cleanliness and hygiene should be observed as at other times There is no risk in the use of soap and water, in spite of the usual prejudice against it a warm bath should, if possible be taken every day throughout the period if this is not possible, you should wash the whole body, including the feet with soap and water There should be a daily action of the bowels, as at other times

3 In order to grow up strong and well, it is necessary that you should have some exercise every day in the open air such as a brisk walk or games It is important that you should continue this exercise, as usual throughout the period, as, by so doing you will probably prevent the one or more days of discomfort and pains later on If you are troubled with slight headache or backache or a sense of fatigue or light pain during the period you should take a brisk walk or play games, or do some work in the house or garden involving bending movements of the body If you give up all exercise, more especially if you lie down, your aches and pains will be *prolonged and increased in severity*

4 If you feel ill at the period and are not able to carry on your usual occupation your doctor should be consulted Any ailments associated with the period are more easily cured while you are young than after they have been established for years

The following table gives a summary of the results obtained at the inquiry at the school and at the training college

	School		Training College	
	Years 1919-1920 734 Girls	Years 1920-1921 612 Girls	220 Students	
	First Interview	Last Interview	First Interview	Last Interview
Dysmenorrhoea—	Per cent	Per cent	Per cent	Per cent
Slight	20.0	10.2	8.6	3.6
Subacute	1.5	0.5	7.2	1.8
Disabling	5.1	0.1	3.0	0.4
Occasional	Not recorded	7.6	2.3	3.5
Rest during period	20.3	4.0	4.0	0.4
Baths during period	11.9	74.3	11.5	32.2
Games etc during period	2.7	61.1	69.5	82.2
Constipation during period	7.0	3.3	2.2	0.9

The method of grouping in this table, which is not based entirely on the girl's own description of her feelings, requires some explanation

Slight Dysmenorrhoea—In this group are placed all those who complain of slight pain or discomfort at the period which is not severe enough to interfere with their work or games It includes also some who describe their pain as dreadful but who, on being asked if it would deter them from playing hockey or going to a dance, say, Oh, *no* It is not bad enough for that

Subacute Dysmenorrhoea—In this class are grouped all those whose suffering at the period is enough to be apparent to others or to interfere with any pleasurable pursuit though they are not incapacitated by it

Disabling Dysmenorrhoea—Under this heading are grouped those who, on account of pain, headache or sickness are unable to keep about even if they have to retire only for half an hour It does not include those who lie down against their own inclinations

Occasional Dysmenorrhoea—In some dysmenorrhoea is experienced occasionally, perhaps once in six or nine months In some cases there is no apparent reason, in others it is associated with illness or temporary change of circumstances such as travelling which usually entails lack of exercise General state that they only experience pain in exceptionally cold weather In many cases dysmenorrhoea occurs only in the holidays when rest is insisted upon during the period These are potentially normal and are not included in this group

Bath during the Period—By this is meant an ordinary warm bath not a cold douche or swimming The unwholesome belief that it is dangerous to wash below the neck at these times is still prevalent Twenty five per cent of the schoolgirls have not followed the advice given in this respect, the reason, in most cases being that the doctor at home has not given his consent

Games etc, during the Period—This means the voluntary continuance of games such as hockey, lacrosse, cricket, tennis,

* This leaflet is issued by authority of the Council of the Medical Officers of Schools Association.

whether practice or in matches, also drilling, gymnastics, riding, cycling, or dancing It is very striking that among the school children the desire to continue their games as usual is almost universal, yet a *considerable proportion are still prevented from doing* so by restrictions from home Many have discovered before I see them that unless they get some exercise on the first day of the period pain is liable to occur

Constipation is not common among these girls, but is more frequent during the period than at other times

The first column of figures in the table is derived from questioning the schoolgirls during the first five years of the investigation, *and were obtained at the first interview, before they* had received any teaching or direct influence from me Most of the girls had already been menstruating for two or three years

The second column of figures was obtained during the last four years, at the last interview, of girls who had all previously received my usual advice *with regard to the hygiene* of the menstrual period The majority of these were over 18 years of age We thus get the longest time test available for comparison

The second pair of columns of figures were obtained from 220 training college students The number is too small to allow definite conclusions to be drawn, but is, I think, sufficient to be of some interest The students stay only two years in the college, *and the sets of figures were obtained from questioning* them on their arrival and departure respectively

The facts which are brought out by these two independent sets of figures are

1 That the incidence of dysmenorrhoea has been reduced in each case, the total reduction being approximately 75 per cent

2 That there has been a decrease in the number of those who lie down during the period, and a marked increase in the number who have warm baths and take their exercise as usual

3 It will be noted that the total incidence of dysmenorrhoea is less among the students than in the case of the schoolgirls, *in spite of the fact* that the former are all over the age of 18, when dysmenorrhoea is more common than in earlier girlhood The explanation of this is, I think, to be found in the fact that the practice of resting during the period when at home was less common, and the continuance of exercise was much more usual than among the schoolgirls The students, as a whole, come from humbler homes, where it is not so customary to interfere *with the natural activity of children* during their menstrual period

4 There is a decrease in the number of cases of constipation

I am sure it is the practice of suddenly stopping all activity during the period, together with the associated idea of invalidism which it inculcates, that is responsible for the relatively high proportion of cases of dysmenorrhoea among women of the educated class Notwithstanding the fact that its incidence has, I believe, been overestimated, I do not think there is any one factor which mitigates against the success of unmarried women in their various callings so much as this preventable source of monthly disability

Although I do not know of any figures which confirm mine in this country, support of the practice I advocate is to be found on the basis of experience in America Dr Florence Meredith, in her article on "Functional menstrual disturbances,"[2] writes

"A physician who examined a large number of college girls ten years ago found that 75 per cent had dysmenorrhoea quite regularly At the present time out of 749 girls only 17 per cent were troubled at all by pain at the menstrual period and only about half of these regularly The reason for the decrease I believe to be first, an improved attitude in the minds of the girls towards the menstrual function For the most part they now consider it, as they should a normal function, one which should not give them pain and not be anticipated as a time of invalidism The second reason for the improvement is, I think that girls are now indulging in a much greater degree of general activity during the period"

She also writes

"I have never seen a single girl harmed by any activity which she would normally take or any kind of baths to which she was habituated, even cold ones when taken straight through the period"

I can certainly corroborate this statement

There is no doubt that the best means of reducing the incidence of dysmenorrhoea throughout the country would be to teach every schoolgirl the simple rules of hygiene of the menstrual period If the medical profession, when the headmistresses are asking for guidance in the matter, were to follow the lead of the Council of the Medical Officers of Schools Association in its attempt to bring this about, I believe that, in one generation, there would be a marked reduction in the number of cases of dysmenorrhoea I would suggest that the "Advice Leaflet" quoted above be distributed also among girls working in factories and other industrial institutions

If dysmenorrhoea came to be looked upon as a disqualifying complaint in a woman worker, many of the cases which could be cured by exercise would disappear, and the others, instead of suffering in silence, would seek treatment from their doctors Though some individual hardship would be entailed, the amount of suffering throughout the land would be very much reduced, and, with it, would be removed the chief source of the inefficiency of the unmarried woman worker compared with the man

There is one suggestion I would make both with regard to schools and factories, and that is that private lavatory accommodation, with facilities for washing, should be accessible to girls and women during the period The chafing and dragging caused by wearing the same sanitary towel too long often leads to abrasion of the skin with intense pain I am sure that the sum total of suffering from this cause far exceeds that from dysmenorrhoea It is a cause of absence from work and social engagements of women who have to spend many consecutive hours away from home, and deters schoolgirls from their games and drilling, and gives rise to the impression that menstrual disability of a more serious nature is commoner than is really the case

TREATMENT OF DYSMENORRHOEA

The treatment of dysmenorrhoea described in all text books, and faithfully adhered to by most general practitioners, is rest in the recumbent position, with a hot-water bottle to the abdomen, and drugs If by this means the pain is not kept below the point of toleration by the patient, an operation for dilatation, or incision, of the cervix is performed

My own experience is that not only is exercise prophylactic against dysmenorrhoea, but that most cases already developed in young women can be cured by the same means In my opinion operation should not be performed, nor even suggested to the patient, until a course of treatment by baths and exercise, with a judicious administration of drugs, has been tried for at least six months and found useless Patients have to be taught that the treatment of dysmenorrhoea does not consist in relieving the pain after it has begun, but depends very largely on the regulation of the health by daily exercise in the open air—the exercise to be continued throughout the period I have found that the first essential in the treatment of a case of dysmenorrhoea is to eradicate any previous notions that menstruation is an ailment which requires nursing In the case of young girls attention has to be paid chiefly to correcting the views of the mother, and often considerable time and patience have to be expended before this very important preliminary process is completed There is no difficulty in convincing the children

Having ascertained by routine examination that there is no evidence of disease or structural abnormality, I advise the patient to take a bath, when possible, at the beginning of the period, hot enough to flush the skin, and to continue this daily throughout the period, even after the onset of pain I know of nothing which gives relief so promptly It is far more efficacious than the hot-water bottle, as is only to be expected The daily exercise, which should involve bending and swaying movements of the body, should be begun some days before and continued throughout the period The exercise should, if possible, take the form of work, or games, or sport, so that the patient's mind may be diverted from her condition For a woman who is engaged in sedentary work all day, exercises done in the bedroom in the early morning will generally suffice, but in all cases it must be vigorous enough to promote a healthy glow or even gentle sweating For nervous women I generally prescribe some mild analgesic for the first three periods, but often find it is discarded after the first

It is exceptional to come across a girl whose dysmenorrhoea is not cured, or much relieved, by these means. Having once experienced the desired result no more encouragement, or treatment, is usually required. The patient keeps herself well. The failures have been in those cases where the patient cannot be persuaded to try what she considers too drastic remedies. The following is an illustration of this type of case:

A lady complained that two of her maids both nearly 30 had to be sent to bed for at least a day every month. They had been troubled with dysmenorrhoea for many years and in spite of every care the pains were increasing in severity. The girls were persuaded to face the risks of the hot bath which gave them temporary relief, but efforts to make them take exercise failed entirely. I was assured that any attempt to keep about at all on the first day of the period turned them green. Drugs had no effect whatever. Treatment was therefore stopped and the resigned themselves to their suffering.

About two years later, during the second year of the war, they came to me for advice, saying that they were anxious to take up farm work in a neighbouring village, but that the condition of service was that no leave of absence was granted for any monthly disability. I encouraged them to go and heard nothing more of them until they appeared after the armistice on account of an outbreak of scabies among their fellow workers. They had been free of all menstrual trouble. One of them had felt nervous at the beginning of her first period when she was engaged for three hours throwing up large trusses of hay on to wagons with a pitchfork. To her surprise the usual pains did not develop, and she felt quite well. She had not had any return of the pain since. Her companion spent the first day of her period removing manure by means of a wheelbarrow from one part of the farm to another. The result was equally happy in her case. They said that none of the band of twenty women who were engaged by the same farmer had any time off on account of menstrual disability.

Another case of unexpected self-cure was that of a lady wintering abroad who on the first day of her period received an urgent summon home. She had therefore to rise from her bed and pack a large trunk (excellent exercise). This she found stopped her pain which usually lasted for two days and she travelled in comfort.

To show that active, outdoor life is not always prophylactic against dysmenorrhoea unless the activity is continued during the period, I will refer to one other case.

Nine years ago a lady farmer brought one of her pupils, a girl of 19, to me on account of dysmenorrhoea which rendered her incapable of work for nearly three days. A dull aching pain began on the day preceding the period. The menstrual flow for the first three hours was very scanty and during this time the pain was agonizing and was accompanied by vomiting. When a freer flow was established the character of the pain returned to that of a dull ache. I gave the usual advice as to baths and exercise. The lady farmer informed me this spring that after three months of the treatment the patient had no trouble whatever, and she has never been able to detect since that time when the girl is having her periods.

I have no collective results of the treatment of the severer cases of dysmenorrhoea among the schoolgirls I inspect, as a few cases only have come under my own care. In the ordinary routine I refer cases requiring treatment to the medical men in charge of the boarding-house. In my private practice I find it difficult to keep complete records. Patients fail to report progress, especially when there is no further trouble and they know that the remedy lies in their own hands. No doubt, as a general practitioner, I am consulted by a larger proportion of women suffering from the milder types of dysmenorrhoea than probably is the case with the consultant gynaecologist.

In a hundred consecutive cases of dysmenorrhoea in nulliparous women with no organic disease of whom I have had subsequent reports, the following results were obtained from treatment by baths and exercise:

Fifty-nine were cured. Thirty of these had in addition some drug treatment for the first three months.

Thirty-two were relieved of the pain but were conscious of some discomfort. Of these twenty-two were helped by drugs.

Nine were no better. Six of these did not give the treatment a trial. Three of them were relieved after the backward displacement of the uterus was rectified.

One, on whom I did a dilatation of the cervix nine years ago, was temporarily relieved, but after eight years the incapacitating pain recurred. The patient has lately been treated by diathermy, which has relieved the pain as completely as did the operation.

The drug most usually prescribed has been ammonol. I have not prescribed extracts of ductless glands for dysmenorrhoea itself, apart from abnormal periodicity, or flow, or other symptoms indicating disorder of endocrine secretion. In eleven of the successful cases I prescribed small doses of thyroid extract, and in three cases a poly-glandular preparation.

In most cases the pelvic examination was made per rectum without an anæsthetic. I have therefore no record of the frequency of pinhole os, cochleate uterus, or any minor deviation from the normal which might be found on vaginal examination.

Some observers have found that dysmenorrhoea occurs in 50 per cent. of all women, and that the commonest cause is under-development of the genital organs.[1] It would be interesting to know if any case so diagnosed has subsequently given birth to a full-term child. There is so much variety in the normal that I know not by what standard such a diagnosis is made. I presume that in the case of the ovaries it is based entirely on symptoms, and in the case of the uterus on physical examination. I have not recognized this condition except in the extreme cases, such as the infantile uterus, but these are rare and, in my experience, have been associated with amenorrhoea more often than with dysmenorrhoea. How is it that Nature is found to fall short so frequently in the all-important genital organs in the female, who is otherwise well developed, and that there is no corresponding failure on the part of Nature in the male?

If the effect of treatment may be taken as an indication of the cause of the pain, it would seem that the cases cured by hot baths, exercise, or diathermy are due to congestion, since all of these measures have a stimulating effect on the circulation.

Exercise, the most easily obtained and effectual of the remedies, by giving employment to mind and body, helps also to eliminate the psychological factor.

The type known as "spasmodic dysmenorrhoea" is not so successfully dealt with by voluntary effort, especially when the case is of long standing, though there are several instances of complete cure. But the fact that no case, to my knowledge, has developed among the school or college girls who have continued their games throughout the period, suggests that the prevention of congestion during the early years of menstrual life is prophylactic also against spasmodic dysmenorrhoea.

The treatment of dysmenorrhoea, as it occurs to-day among industrial workers, is a subject well worth careful consideration.

In the *Journal of Industrial Hygiene* published in February last year, Dr. Samuel Meeker wrote a preliminary note on "Dysmenorrhoea as an industrial problem."[4] His opening statement is, "Dysmenorrhoea is the commonest of all female ailments." According to his findings there is an enormous loss of work from this cause in America. He puts in a strong plea for the more general keeping of menstrual records in industrial concerns and adequate treatment of sufferers. The records would be most valuable, but if the method of treatment he advocates were realized we should probably find that the incidence of dysmenorrhoea among workers would increase rather than diminish. The "necessary arrangements" he suggests are a room with beds, a tactful nurse, a physician to be available for those who wish to see him, hot-water bottles or electric heating-pads, malted milk, etc., for hot drinks, and a selection of suitable drugs. Those things may be very comforting to a girl actually in pain, for whom I would provide a hot bath and a couch, but I would replace the hospital ward by an empty room or, better still, a court in the open air, where the girls are encouraged to go through a short course of exercises daily, the exercises not to be missed during the period. By some such means, prefaced by some teaching on the subject by a medical woman, I believe we should do away with the majority of the cases of dysmenorrhoea.

If all employers of female labour were to follow the example of the Gloucestershire farmer referred to above, in refusing leave or absence for menstrual disability, I am inclined to think that the extra hardship endured by the few would be well compensated for by the benefit conferred on the many.

II.—LEONARD PHILLIPS, M.S., B.Sc. LOND., F.R.C.S. ENG.,
Obstetric Tutor, St. Mary's Hospital, Paddington

I MUST congratulate Dr. Clow on her very excellent paper, a valuable contribution to a subject the pathology of which is but little understood.

I agree with much of what she says. For some years I have been treating patients along similar lines with very gratifying results. However, I would not go so far as to say that most cases of dysmenorrhoea without physical signs are curable by exercises and hot baths continued throughout the period. Unfortunately we find only too often that the pain persists in spite of careful hygienic treatment, and I can recall cases of intractible dysmenorrhoea in women athletes of the highest order. Sometimes hygienic treatment, drugs, and operation are all tried in turn and fail, and the patient is obliged to endure a constantly recurring and distressing ailment, or submit to a major operation such as hysterectomy.

There is no royal road to the successful treatment of all *dysmenorrhoea cases. It is true that there is a definite* clinical type of dysmenorrhoea dependent on faulty hygiene and curable by hygienic treatment, but there are other clinical types due to various causes, some of which are very imperfectly understood and which, in my experience, are not curable by hygienic methods of treatment, sometimes not curable by any method of treatment short of stopping the periods completely.

In a paper read before the Royal Society of Medicine last year I analysed the results of treatment in one hundred consecutive cases in my out-patient department, pointing out that various clinical types of dysmenorrhoea exist, each demanding its own particular treatment. With regard to the "hygienic type" it was stated:

"Dysmenorrhoea is frequently a disease of faulty hygiene and living. A large proportion of patients conform to a definite clinical type. They are thin, anaemic, poorly developed, hypotonic, with weak abdominal muscles, absent abdominal breathing, and faulty posture. They are frequently constipated, have visceroptosis or a bad circulation, and lead indoor lives with little exercise and less fresh air. Naturally the uterus is sometimes arrested in its full development and possesses a feeble musculature, easily exhausted if compelled to do much expulsive work.

"An exhausted muscle forced to continue its contractions gives rise to cramp and severe spasmodic pain, true alike of the heart, the gastrocnemius, or the uterus. *Constipation has a bad influence,* for a mass of faeces in the pelvis may act as a pelvic tumour pressing on the veins and aggravating the congestion and menstrual pain. Often complete relief can be obtained by improving the faulty conditions above outlined, in the following manner:

"'1. *Establish the Correct Mental Attitude.*—The patient must be made to realize that the period is a *natural function,* she is not ill, and must bathe and take exercise as usual.

'2. *Correct Clothing.*—No constricting garments should be worn which are likely to impede the pelvic circulation, if corsets are adopted they must not do the work of the abdominal muscles.

'3. *Correction of Constipation.*—Plenty of water should be drunk and fruit eaten. Overeating is bad, but enough food should be taken to give bulk to the intestinal content. *exercise in the fresh air,* abdominal kneading night and morning, and a regular attempt to empty the bowels at the same time every morning should be insisted upon. Purgatives should be used temporarily only, and paraffin chiefly relied on, if possible, while a regular daily reflex is being established.

'4. *Exercise and Exercises.*—Walking, light Indian clubs, tennis, and hockey are recommended. The object is to increase the tone of the musculature of the abdominal wall, bowel, and uterus, to improve the general and local circulation, and so to produce improved nutrition and muscular development. Many patients do not realize that the abdominal wall contains muscle. They allow their corsets to do the work of the recti and obliqui inducing viscero ptosis, constipation and defective abdominal breathing. They must be taught—to produce hardening of the abdominal wall at will—breathing exercises night and morning before a mirror standing in the correct attitude, and exercises to develop the abdominal muscles such as lying flat on the back, then raising themselves into the sitting posture, keeping the legs and heels in contact with the bed or couch. Leisure must not be spent in emotional recreation such as the theatre, cinema, or novel reading, but in walking or exercising in the fresh air.

It is much less common to see robust women suffering from *dysmenorrhoea. Make the patient healthy and strong and often* you will cure the dysmenorrhoea. Too much emphasis cannot be laid upon the importance of faulty upbringing, surroundings, and development as a causative factor in dysmenorrhoea, and the need of improving these as a first step in treatment.'

For some years now I have been interested in dysmenorrhoea without physical signs, and have kept careful notes of about four hundred cases. All these women had very definite and disabling pain, and most were sent to me privately or to hospital by their medical attendants after an unsuccessful trial of medical treatment. In my hospital out-patient department such dysmenorrhoea cases constitute between 10 and 15 per cent. of the total number of women seeking relief.

In the short time at my disposal I think it would be best to mention briefly some of the more important and less appreciated facts which have impressed me after an analysis of these cases.

1. *Hygiene.*—The majority of the patients lead inactive or indoor lives, "nurse," "typist," "clerk," "machinist," "leather-worker," are found constantly in the notes under occupation. In one-half of the cases constipation constituted a definite complaint. One-third of the patients were poorly developed, with weak abdominal musculature, faulty posture and breathing, anaemia and visceroptosis—the class so much improved by hygienic treatment.

2. *Clinical Types.*—Little attempt has been made in the past to divide cases into groups founded upon constantly recurring clinical similarities. The variations in the site, time, duration, and character of the pain are very great, and, together with varied general conditions and local findings, suggest the possibility of several causative factors in dysmenorrhoea, even though gross pelvic physical signs are usually absent.

3. *Physiological Dysmenorrhoea.*—It is so often stated that intrinsic dysmenorrhoea begins at puberty and recurs at each subsequent menstruation. Some cases do, but a greater number establish menstruation painlessly, the dysmenorrhoea developing several years later, and for no apparent reason. Moreover, many women have painless periods alternating at intervals with painful ones. The importance of recognizing this fact is obvious, for in such cases an organic or developmental *fault cannot be adduced* as the cause. If it were so we would expect the pain to start with the first menstruation and to continue with each subsequent period.

4. *Functional Dysmenorrhoea.*—I am convinced that there is a strong psychical element in *some cases.* I can recall a case of dysmenorrhoea in which operation had been advised, but it was found impossible to pass a sound or even a probe into the uterus, so the operation was abandoned. The patient was not informed of the fact, her dysmenorrhoea, however, ceased from that time.

Many articles are written in support of various methods of treating dysmenorrhoea, but the originator of the treatment is usually more successful than his followers. This is often because so much depends upon the personality of the doctor, and on the fact that he is interested in his subject, so taking pains and exercising patience, while confidently assuring his patient of the success of his treatment. It is never wise to *mention operative* treatment until other methods have been tried. The results of operations for dysmenorrhoea leave much to be desired, and *cases in which* dilatation, curettage, or anterior hysterotomy have failed, can sometimes be subsequently cured or improved by non-operative treatment.

5. *Obstructive Dysmenorrhoea.*—This is the oldest theory and the one most constantly decried at the present time. *Yet there is* an accumulation of facts suggesting the existence of an obstructive factor in some types of dysmenorrhoea. *To illustrate the possibility* of such a condition I would like to refer to two cases which came under my care. Both of these *patients were* married women suffering from leucorrhoea due to a badly lacerated cervix. Neither of them had ever *suffered from pain* at the periods. Amputation of the vaginal cervix was *performed* for the leucorrhoea. Subsequently severe colicky dysmenorrhoea, exactly similar to so-called spasmodic dysmenorrhoea, developed. In both cases it was found that some true acquired stenosis of the cervix had developed as a result of the amputation, and it was difficult to pass a *probe into the* uterus. Anterior hysterotomy was done in each case, and the dysmenorrhoea then ceased.

6. *The Relation of Age to Cure.*—The younger the patient when first brought under treatment the better the results, from 16 to 20 years of age the percentage of successes is high. Severe cases over 25 years of age are more difficult

to cure, and cases over 30 are usually intractable and constitute the bulk of the failures. Recently I was consulted by a woman in her thirties who had been told when she was quite a young woman that nothing could be done for the menstrual pain, which she must endure throughout her life; after treatment her pain is now negligible. Often, however, this result cannot be secured in cases left so long untreated. It is important to treat cases early, to persist in the treatment, and not to abandon the patient to her pain. There are few other pelvic conditions in which patients are so grateful for an alleviation of their pain.

7 *The Question of Pelvic Hypoplasia in Cases of Dysmenorrhoea and the Uses of Ductless Gland Extracts.*—I think it is important to obtain a consensus of opinion on this subject, since individual and combined extracts of ductless glands are so frequently prescribed on the assumption that a moderate degree of pelvic hypoplasia exists.

I agree that it is difficult to make out a proved scientific case in favour of this theory, concerning which great diversity of opinion exists. It is maintained against it: (1) That it is difficult to estimate accurately the size and degree of development of the uterus by ordinary methods of bimanual examination. (2) That in cases of so-called incompletely developed uterus the sound usually passes the normal distance. (3) That these uteri, when inspected through an abdominal incision, do not appear to be as small as one would expect from the bimanual examination. (4) That all uteri are not made to one constant pattern, and that variations within limits are possible in the normal case.

On the other hand, gynaecologists with out-patient departments are familiar with a common type of case in which the cervix is very small, the anterior lip almost absent, the anterior vaginal wall short, the fornices less roomy than the vaginal introitus, the uterus less bulky than in most nulliparous women, or else retroverted or acutely anteflexed. These cases are often associated with amenorrhoea or with long and irregular intermenstrual intervals. Dysmenorrhoea and sterility are commonly present and combined. The male type of pelvis and pubic hair may also be noticed. Personally I believe that a moderate degree of arrested development is fairly commonly met with amongst gynaecological out-patients, though how frequently it occurs outside hospitals in apparently normal women I do not know.

In four hundred of my cases of bad dysmenorrhoea one-third occurred in married women, and practically all were *sterile over periods varying from* three to seventeen years. There are two very suggestive facts in favour of an endocrine basis in some dysmenorrhoea cases: (1) the well known association of dysmenorrhoea with sterility, a fact emphasized many years ago by Matthews Duncan, (2) the remarkable success of organotherapy in some cases.

Though often disappointing, the administration of extracts of ductless glands is sometimes extremely encouraging. In some cases remarkable results are produced in a most dramatic manner, and patients are deeply grateful for the relief. I have some who remain free from pain while they take thyroid extract just prior to the period. *Cases with long and irregular intermenstrual periods and scanty flow sometimes derive much relief from combined extracts of ductless glands*, especially thyroid, ovary, and pituitary. Again and again in such cases (associated as they often are with small uteri) the administration of polyglandular extracts is followed by regulation and stabilization of the periods, and ultimately by pregnancy and childbirth, with its frequent cure of the dysmenorrhoea.

8 *Operative Treatment of Dysmenorrhoea.*—It is important to realize that drug treatment as practised at present is palliative only, requiring repetition at each painful period. On the other hand operative treatment may be curative and permanent, though the percentage of permanent cures is not high. In an analysis of two hundred cases subjected to operation I found that 25 per cent. were cured, 25 per cent. improved, and 50 per cent. were unaffected or made worse. It is important, therefore, not to guarantee a cure when recommending operation in cases of dysmenorrhoea. The operations performed were: (1) dilatation alone, (2) dilatation with insertion of a hollow glass stem for varying periods, (3) dilatation and curettage, (4) anterior hysterotomy.

Dilatation gave the best results when performed in young women with central suprapubic spasmodic pain only, and when divulsion rather than dilatation was performed.

Curettage gave the best results in married women, especially when menorrhagia was present or casts expelled.

Hysterotomy proved valuable in acutely anteflexed undersized uteri, especially when the clinical picture suggested an obstructive causal element. At first I was encouraged by the results of this operation, but I now regard it as of no greater value than curettage, except in the special type of case mentioned above. Moreover, it is an extremely difficult operation to perform. The cervix as a rule can only be pulled down very little, and the operation is done through a narrow virgin vagina. It involves division of the vaginal mucous membrane in the anterior fornix, upward displacement and retraction of the bladder, and bold incision of the cervix right up through the internal os. In some of my own cases I applied the well known operation of pyloroplasty to the cervix uteri, dividing the muscle with a knife or cautery and leaving the mucous membrane intact.

9 *Drug Treatment in Dysmenorrhoea.*—The following drugs were tried:

1 Guaiacum resin in a 10-grain pill tids for seven days before the period with antispasmodic during the period.
2 Pill tannate of cannabin ¼ grain tid for seven days before the period with exercise, phenacetin repeated frequently during the pain if it develops.
3 Pituitary preparation plus caffeine gr. iv or each suspected menstrual attack hourly up to six doses. This gives very great relief and is especially valuable in cases of spasmodic recurrent attacks of acute pain spread over one day.
4 Atropine sulphate 1/120 grain tids in cases of intermittent colicky pain extending over a period of two days.
5 Bismuth benzoate (Martindale).
6 Liquor sedans (Parke Davis).
7 Tincture of apiol 3 to 6 minims in solution or in capsule in cases of cannot flow.
8 Potassium bromide gr. x and sodium salicylate gr. x tids before the period with luminal 1/2 gr. during the pain repeated judiciously up to one pair of drowsiness especially in cases allied to migraine.
9 Tincture of pulsatilla mitium x extract of caulophyllum liq. minims xv tids during the period.

The best results were obtained by the use of coal tar antispasmodics with atropine, liquor sedans being sometimes added with great advantage. In many cases of recurrent acute pain of short duration full active treatment is essential, because hygiene, organotherapy, exercises and baths do not prevent the onset of pain, and exercises during the pain are not tolerated.

10 *Radium Treatment as an Alternative to Hysterectomy in Severe and Intractable Cases.*—Women in the thirties suffering from severe and intractable dysmenorrhoea have often in the past been treated by hysterectomy when other and less severe measures have failed. I believe that the insertion of radium into the uterus, with a consequent cessation of the periods, provides a simpler, safer, and yet equally effective alternative. An insertion of 100 to 150 mg. of radium for twenty-four hours is usually sufficient. It acts locally by producing fibrosis of the stroma and atrophy of the glands of the endometrium—facts proved by histological examinations of uteri removed subsequent to radium insertion. It is not, in my experience, followed by obscure distressing symptoms or an artificial menopause or by any reduction of the sexual sense. In some cases the menstrual loss has subsequently returned with little or no pain. I have tried this treatment in a limited number of private cases, but this number is naturally too small to form a basis for a general recommendation.

Hysterectomy is a major operation with a definite mortality and certain risks. With radium treatment the mortality is negligible apart from the risk of the anaesthetic. There is an increased risk of subsequent sterility which should be explained to the patient, but it must be remembered that in any case bad dysmenorrhoea is commonly associated with sterility, and that women requiring radium treatment are mostly at an age when the chances, possibilities and desires for childbirth are diminishing.

In conclusion, I would like to emphasize that dysmenorrhoea has not one cause, nor yet one golden road of successful treatment. Every case requires careful investigation in order to discover the underlying causal conditions, and to evolve from these a rational treatment.

GENERAL DISCUSSION

Mr E B TURNER (London) spoke as one who had been through the mill in regard to the treatment of dysmenorrhoea In the course of his long practice he had been accustomed to see about twenty-five women patients to every one man He had been taught as a student the regimen of the couch, drugs, and so on—the bath in those days was unthinkable Then about thirty years ago he had known a lady who was a great cyclist, he was surprised to find that her period made no difference to her activities This made him think of the many women he knew who had to go to bed during that time Then he became connected with an institution, and found that athletic girls went through the whole course of their training without any trouble One very active girl started pain and flooding when she stopped games and exercise on taking up a sedentary occupation Resumption of exercise led to immediate improvement For years now he had advocated baths and exercise He looked after a large girls' school and a hostel for young women, and he had been striving to set aside the prejudices of mothers regarding this point, in consequence dysmenorrhoea in these establishments had decidedly diminished He was certain that if the doctrine of healthy exercise could be spread among all girls dysmenorrhoea would almost disappear, especially if they were taught young One of the chief reasons why in Government departments the pay of women was not equal to that of the men was on account of the number of days they lost owing to menstrual trouble The exercises recommended must be sensible and in accordance with the girl's individual strength His experience was that girls who suffered from dysmenorrhoea generally had a bad time at their confinements Ordinary games did a girl no harm, either at the time of the monthly period or in subsequent pregnancy

Dr CATHERINE CHISHOLM (Manchester) congratulated Dr Clow on her paper and the conclusions, which, as regards evidence and prophylaxis particularly, were practically the same as she herself had published in her thesis in 1912 All who had studied dysmenorrhoea among normal girls rather than in the consulting room were in agreement that dysmenorrhoea even of slight character occurred only in a minority of cases In her opinion it was found among delicate and weak girls rather than among strong ones, it was apt to develop when and if the normal health deteriorated, and to improve with the improvement of the general vigour The practice of games and outdoor activities, bathing, and all hygienic exercises was therefore naturally of advantage In her original figures of 500, gathered at a high school in a big town, the number disclaiming any disability of any kind at the monthly time was 58 6 Lately she had collected a further 500 figures In the interval a generation had grown up which had been advised on the lines which Dr Clow had described the cure had improved to 66 78 Among the senior students who excelled in games as well as in mental work the original figure was 70 4 Among the anaemic and debilitated—that is, girls with less than 80 per cent of haemoglobin on the Tallqvist scale—only 47 5 were free from menstrual disturbances In cases with a tendency to menorrhagia as obtained occasionally in the adolescent, but not as frequently as one expected, the amount of dysmenorrhoea was comparatively high Among 437 training students picked in health, and practising games as a general rule, the figure was 89 per cent of freedom from dysmenorrhoea and even slight pain In the case of another high school where games were a much more regular and integral part of school life than in the Manchester school the freedom was well over 90 per cent on careful questioning A large proportion of these girls were very young

Of 100 adult cases collected for comparison in 1912, and consisting of a very mixed set of women, teachers, doctors, nurses, etc, the freedom from dysmenorrhoea was only 23 per cent On investigating the manner in which pain began in these cases many confessed that as school children they had little if any pain Thus apparently a large amount of pain developed during menstrual life, and if the cause of this development were to be discovered much suffering might be relieved by prophylactic treatment The adult women she had questioned in many cases volunteered the information that with exercise they were much better The frequency with which varicose veins and piles were found in women following sedentary occupations would lead to the assumption that in the pelvis a similar passive congestion took place, which would be particularly full as the monthly cycle culminated Another factor in the production of pain was apparently mental strain

In dealing with dysmenorrhoea they had, then, two types (1) That which occurred with the onset of menstrual life, which was comparatively rare, it might be due to developmental defects or malpositions, which had to be treated accordingly (2) That which developed later and which was a symptom of something wrong in the general health Once it occurred it was liable to persist unless treated Dysmenorrhoea formed a vicious circle it exhausted the already tired individual, and the psychical suggestion that it was to be expected each month did the rest Prophylactically, then, they should encourage the young and healthy girl to carry on her normal activities, having first ascertained that the amount she was called upon to do mentally and physically was well within her power This was important for the school medical officer, and she had very different problems to deal with in the boarding-school, the town secondary school, and in industrial life Exercises, etc, were most important aids to healthy life, but they must not add them on as an extra strain to the already overburdened life of the schoolgirl, with her train journeys, her musical practice, and her social duties in the home Some adjustment must be made, nor must they encourage school authorities or school medical officers to force all girls to play during the monthly time when they did not feel fit Dysmenorrhoea was pathological, and exercises ordered for it must be graded according to the extent and cause of the disorder, or a worse condition would follow with the swing of the pendulum towards the compulsory practice of games Girls with profuse menstruation must not play till their flow was regulated Girls anaemic and exhausted must first be treated intermenstrually with tonics, given light work, and little if any exercise at the monthly times till their muscular and nervous tone had recovered Girls with severe pain must be given analgesics for a time during the beginning of treatment, the suggestion being constantly held before them that they would within three months lead a normal life Irregularity must be treated with endocrine therapy where other indications justified this The important thing was to persuade mothers and family doctors to regard even slight degrees of dysmenorrhoea as worth serious attention and careful treatment, since in this way much useless physical suffering could be avoided

Dr RHODA ADAMSON (Leeds) said that her experience of dysmenorrhoea and its prevention fell under three headings (1) the treatment of cases of dysmenorrhoea already established in patients of her own private practice, (2) the observation of students taking a four years' university course—of these there were sixty new admissions yearly, and (3) working women who undertook work in connexion with an engineering factory during the war—about four thousand The patients in Classes (1) and (2) in many cases had lived in unhealthy life and had frequently followed the course described by the opener In most cases the dysmenorrhoea ceased or was alleviated by regular baths, exercise, and attention to bowels In a very small proportion it had persisted, and had called for further treatment by tonics to improve the general health, and analgesics, especially coffee and immonol The small fraction of all cases who continued unrelieved by these means had come to operation—either dilatation and curetting or treatment by diathermy Of the two she personally had a preference for diathermy Class (3) only exceptionally suffered from dysmenorrhoea and very rarely required drug treatment, though there might be need to advise a little more personal cleanliness, etc Dr Adamson had had the opportunity in many cases of persuading the mothers of several girls in a family to alter completely their routine care of the younger ones with the onset of menstruation In each case the younger girls had been better in health, and the mothers had been convinced of the advantage of the continuation of daily baths and regular exercise The next generation should suffer less than girls had done in the past.

Dr MINNIE L C MACGREGOR (General Post Office, London) said that in the Post Office there were over ten thousand women of ages varying from 14 to 60 employed on different kinds of work with varying times and under different conditions. She was not able to give the exact amount of time lost on account of dysmenorrhoea but the average amount of time lost from all causes, minor accidents and illness was under two days per officer per year. She thought that a very generous estimate of time lost on account of dysmenorrhoea would be one and a half days per officer per year, apart from the loss of a whole day they had to reckon with a certain amount of time spent in the sick bay—from an hour at a time up to half a day. The total average time so spent worked out at two hours per head per year. She had kept a record of the occurrence of dysmenorrhoea in girl probationers when they were examined on entrance to the service between the ages of 14 and 15. The results of this she had set out in the following table:

Examination on Entrance (14 or 15 Years Old)

Group	Total	Menstruation not Started	No Pain	Pain but no Rest Required	Pain requiring Occasional Rest	Pain requiring Frequent Rest	Totally Incapacitated
A	423	13·6	60·5	27·5 (91·0)	4·0	1·3	0·3 (1 case)
B†	506	23·2	82·4	14·0 (96·4)	3·9	0·3	Nil
C	1123	40·8	81·0	13·2 (94·2)	3·4	0·7	0·2
D‡	807	27·0	70·7	17·0 (93·7)	2·9	0·5	Nil

Same Girls Re-examined One to Two Years Later

A	362	0·3	65·3	26·7 (92·0)	6·5	0·9	Nil
B	346	4·6	65·8	26·7 (93·5)	6·1	0·3	Nil
C	525	6·8	67·0	26·8 (93·8)	5·9	2·0	Nil
D	589	2·4	68·5	24·9 (93·4)	5·6	1·0	Nil

* Pre war † First two years of war ‡ Since 1920 Second two years of war

From this table they would see there were only two cases of total incapacity on account of dysmenorrhoea among three thousand girls. In regard to treatment she would say very little as it was not the subject on which she had been asked to speak but she had found that a course of iron was the best curative, the course to be spread over from six to twelve months. Their sheet-anchor palliative had been a mixture containing spirits of chloroform and red lavender. She thought that the greater proportion of suffering from dysmenorrhoea occurred between the ages of 20 and 30.

The PRESIDENT, inviting other speakers to take part in the discussion, expressed his gratitude to the medical women officers of institutions for the very valuable statistics they had so carefully compiled. He thought that Bradford, which was a very large centre of the textile industry, was a particularly good locality for the discussion of the subject they had before them as with the employment of so many women in industry there should be useful data to be obtained in the neighbourhood.

Dr M E WESTON (Leicester) gave figures collected at school inspections. She had found that the average age for the onset of menstruation was 13 years and 8 months. There did not appear to be any difference in regard to dysmenorrhoea between those starting early and those starting late. Two girls who had started at the age named were no worse than others who started at the normal age of 10 [illegible]

In her records only 3·5 per cent. suffered from pain or discomfort, and 40 per cent. of those had constipation, 4 per cent. of the total number had profuse menstruation, and 3·5 per cent. suffered from really severe pain. The time covered by her investigation was three and a half years. In the days before medical inspection was started the general rule had been no baths, no gymnasium, no games during the first two days of the period. Many mothers had stopped their daughters from bathing one week before the onset so as to be on the safe side. One mother had even complained of her daughter having to wash her hands in cold water when she was menstruating. Since medical inspection the general rule was not half for all boarders, one school allowed a hot bath at any time of the day to any girl who complained of severe pain. As regards exercises, she had barred gymnastics, hockey and net-ball, all other kinds being permitted. She thought that perhaps a little restriction like that would give to parents more confidence that the medical officer was competent to give advice on this subject. In the elementary schools absence on account of dysmenorrhoea had been negligible until recently, when the age for leaving school had been raised. It was found now that a large number of mothers kept their girls at home while they were menstruating, not on account of illness, but from a feeling of *modesty, they did not think it right for their girls to mix with others at such a time.*

Dr W A POTTS (Birmingham) thanked Dr Clow for her valuable paper, and asked whether she made any rules about sea bathing, also if she found the mentality was affected during menstruation. In those cases where hygiene and physical treatment failed he would like to put in a plea for psychological treatment, properly carried out by a psychologist, and continued for a sufficient length of time. Of course, all necessary physical treatment must be carried out first, but when that had been done it should be realized what a serious step it was to operate when pain was the only symptom.

Mr ALECK BOURNE (London) paid a cordial tribute to Dr Clow's paper and to the important and valuable work of medical women in this branch of gynaecology, only since dysmenorrhoea had been investigated on these lines had they obtained rational ideas of the conduct of this function. Two broad classes of dysmenorrhoea were met with in practice: first, the large class of artificial menstrual invalids, the result of the teaching of wrong ideas in adolescence, and secondly, the small group of real pathological dysmenorrhoea. The first group were difficult to treat, according to the age of the patient—difficult over 25 and almost hopeless over 30. The second group should be regarded from the pathological point of view and treated according to requirements. Polyglandular extracts were of real value when hypoplasia was present.

Dr J J HOLLAND (Western Australia) was under the impression that the bulk of menstrual pain was ovarian in origin. Where he lived they had very few women doctors, so that no statistics had been collected comparable with those which had been laid before them. He had asked bank managers and business men who employed both men and women how the women compared with the men as workers, and had been told that as a rule the women were better workers, but that they were a nuisance about the time of the monthly period. As to time of onset his experience had been that dysmenorrhoea did not come on till girls gave up active school life. He thought that this had some bearing on the figures which had been put before them that day. He could not understand why curetting should be done in the absence of definite symptoms since the pain was not uterine but ovarian. He would like to [illegible] Clow had questioned her girls on the pain was [illegible] Did improvement in pain and subject of regularity and in hand? There was no doubt greater regularity go [illegible] menstrual pain was relieved by that in many women [illegible] who were unrelieved often marriage, and that those remained sterile.

Sir MALCOLM WATSON (Federated Malay States) spoke, not as a consultant, but as a general practitioner in the tropics. He claimed to be a general practitioner in the widest sense his practice had been amongst numbers of

Europeans and thousands of natives He had found that white women nearly always developed severe flooding in tropical climates He had been in the habit of treating this by rest and continued doses of ergot and nux vomica From what he had heard that day he was evidently on the wrong lines, and when he went back he would try to persuade these white women to take more exercise It was well recognized in the tropics that men who took violent exercise were fitter, and kept fitter, than those who did not In regard to Asiatics, he was concerned with plantations where boys and girls began work about the age of 10 He had often wondered how much silent suffering was going on among these workers, especially in the women at their periods He was glad to hear that it was probably a good thing for these women to work as they had been doing

The PRESIDENT welcomed the very great help they had received from the women doctors in making them look at the subject of menstruation with a greater sense of proportion At a recent meeting he had attended he had been asked to believe that two thirds of all women had their pelvic organs misplaced and suffered dysmenorrhoea in consequence He thought that specialists did not gain a proper view of this subject, as they saw the pathological cases only The teaching of hygienic methods was extremely important It was odd that he had never yet come across a woman who both passed a membrane and suffered from dysmenorrhoea at the same time He had met with women who passed membranes and women who had dysmenorrhoea, but never the two combined in the same patient It was idle to speculate whether the pain was uterine or ovarian it might be part of a general metabolic disturbance, and it was on this theory that endocrine preparations were tried He thought that the difficulty in the treatment of dysmenorrhoea in older women was that they had had so many recurrent painful impressions that it was extremely difficult to eradicate them

Dr A E SANDERSON CLOW, replying to the questions submitted by Dr Potts, said that for aesthetic reasons sea bathing must be vetoed during menstruation The actual bath would do no harm, a cold bath did no harm She had been told of chills coming on after bathing being followed by prolonged amenorrhoea, but thought that there must be some other contributing factor in these cases, since she had come across women who had accidentally bathed as menstruation was coming on with no bad results at all She said that the girl's mentality certainly might be affected during her period Mistresses had told her that some girls became very depressed and others became very irritable She was quite sure that exercise and psychological treatment combined would cure a large number of cases She agreed with Mr Bourne that it was much more difficult to convince the mothers than the girls themselves She had been very interested in what Sir Malcolm Watson had told them, she supposed it must be very difficult to get women to take exercise in the tropics

IMPERFECT URINARY CONTROL FOLLOWING CHILDBIRTH, AND ITS SURGICAL TREATMENT

BY

B P WATSON, M D, I R C S E,

Professor of Midwifery and of Diseases of Women, University of Edinburgh

A VERY considerable number of women who have borne children suffer from more or less marked inability to control the urine under physical strain The condition is most often found in association with cystocele, but may be present when there is little or no sagging of the bladder It is a symptom which is very often not mentioned, and is only elicited on direct questioning of the patient My attention was called to it some five years ago, and, since then, every gynaecological patient coming under my care has been specifically questioned on the point In a series of 63 cases of cystocele operated on by me in the Toronto General Hospital incontinence of urine on straining, laughing, or coughing was mentioned in only 19 of the histories, but on sending a questionary to the patients eighteen months ago it was found that 22 others had suffered in the same way prior to operation, making a total of 41 In 21 private cases 18 had incontinence of urine, and in 99 cases operated on in the Royal Infirmary, Edinburgh, in the last eighteen months 61 suffered from lack of urinary control Thus in a total of 183 cases of cystocele, incontinence of urine was present in 120, or 66 1 per cent I believe that the percentage is still higher, for a number of our histories were proved to be incomplete and a number of the patients did not reply to the questionary

It seems strange that a symptom so distressing should not always be voluntarily mentioned when it is present, for the least extra physical exertion, such as lifting a weight, making a sudden movement, stepping up on or getting down from a tramcar, coughing or laughing, may result in the uncontrolled escape of a few drops or of quite a stream of urine The same lack of sphincteric control is occasionally present in nulliparous women, but it is very much rarer in them than in those who have borne children I gave a preliminary communication on this subject to the Obstetrical and Gynaecological Congress in Edinburgh in April, 1923 that communication was not published in full In the autumn number of the *Journal of Obstetrics and Gynaecology of the British Empire*, vol 30, No 3, Victor Bonney contributed a most valuable article on diurnal incontinence of urine in women His article concluded with a paragraph in which he stated that, from the short epitome of my paper which he had seen, he believed that our views regarding the condition were identical To show that this belief was justified let me quote verbatim from what I wrote at that time

"In all patients presenting this symptom I have found that there is a marked sagging of the neck of the bladder away from its proper situation behind the pubes—very often there is a marked sagging of the whole of the anterior vaginal wall and bladder in the form of a cystocele In many, however, the cystocele may not be pronounced, or absent In some cases of complete procidentia where both vaginal walls are completely everted control may be perfect, in such it will be found that the neck of the bladder remains braced up in its normal situation The sagging of the neck of the bladder away from the back and under aspect of the symphysis is very easily demonstrated by introducing a catheter or sound into the bladder on exerting a little pressure the lower end of the anterior vaginal wall can be made to bulge at the vaginal orifice, and a small stream of urine will often escape alongside the instrument I believe that it is this sagging of the neck of the bladder with its surrounding sphincter away from its normal attachment, rather than damage to the sphincter itself, which is the cause of the incontinence The sphincter has lost its *point d'appui*, and so fails to act efficiently" With this explanation Bonney is in agreement

The reason for this sagging of the lower end of the anterior vaginal wall and of the neck of the bladder is that there is a weakening of the musculo-fascial sheet which normally supports the base and neck of the bladder The anatomy of this fascia has been very fully described by Bonney in the paper already quoted Blair Bell in the discussion of my preliminary communication objected to the term "fascia" being applied to this sheet, because, as he pointed out, and as I have since verified by examination of a piece of the tissue, it consists to a large extent of non-striped muscle But when dissected out in the way I am about to describe it has all the characteristics, including extreme strength, which we associate with fascial structure I can therefore see no reason why we should not call it fascia It is not easy to demonstrate in the dissecting room, but in the operating theatre it can be demonstrated with the greatest ease as a strong musculo-fascial sheet passing from the back of the pubes to the lateral aspects of the cervix, intervening between the bladder and the anterior vaginal wall, and attached to both, but more firmly to the latter It is continued backwards alongside the cervix to become continuous with the rectal fascia the vesico-cervical part of it is the chief support of The pul-

the bladder, and any weakening of it will result in cystocele, just as weakening of its posterior part will in the absence also of levator support, result in rectocele. If the levator ani muscles and their fascia are damaged no rectocele follows, provided the rectal fascia remains intact as it very frequently does. It sometimes happens that the *pubo-vesico-cervical fascia is weakened only* in that part which supports the neck of the bladder. No cystocele in the ordinary sense of the word results from this, but the neck of the bladder is permitted to sag away from its normal situation and attachment to the back of the pubes. In such cases there is *incontinence* of urine under strain although no cystocele is present. In other cases the fascia retains its tension in the region of the neck, but is weakened over the rest of the bladder, so that we meet with cases of cystocele with perfect urinary control.

Before taking up the operative treatment a note may be interposed regarding what I believe to be the causes of the condition and its prophylaxis. When the head comes down on the pelvic floor the posterior segment of the latter resists, driving the head forward against the anterior vaginal wall. The more resistant the perineum the more strain is thrown on the anterior segment and on the fascial support of the bladder. An overstretching or tearing occurs from which recovery may not take place and a permanent relaxation results. This strain is further aggravated by the attempts of the obstetrician to "save the perineum" by restraining the sinciput and pushing the whole head forward before the occiput has come right underneath the pubic arch. I believe that in this way the perineum may be 'saved' but it is frequently at the expense of a damaged bladder fascia, which will be evidenced later by a cystocele. For that reason I never hesitate, in cases where the pelvic floor is unduly resistant, to perform an episiotomy. This I also do as a routine in all cases of breech delivery in primiparae as not only does it save the anterior pelvic supports but facilitates in the most marked way the delivery of the after-coming head. Another causative factor is the pushing down of the anterior lip of the cervix by the head of the child. This is most often seen in multiparae, but may occur in a primipara. If it occurs the fascia is as it were stripped off the bladder. Whenever it is noticed the cervix should be pushed up over the head during the pains. If these two factors are kept in mind, and the above mentioned simple treatment carried out, there will be fewer cases of cystocele and loss of bladder control.

Believing, as I do, that the cause of the lack of control is to be found in the relaxation of the fascia supporting the neck of the bladder and not in damage to the sphincter itself, my treatment has consisted in restoring the tension of the fascia in the region of the neck of the bladder so that the latter is braced up to its normal position behind the pubes.

In operating on cases of cystocele I always dissect out the pubo-cervical layer of the pelvic fascia. It is a very strong musculo-fascial sheet, and can be easily traced in its continuity from pubes to cervix. I have found that the easiest way to demonstrate it is to make first a transverse incision at the junction of cervix with anterior vaginal wall, then blunt-pointed scissors are pushed upwards for a short distance between the vaginal wall and bladder in the middle line towards the urethra (Fig. 1). The scissors are opened out withdrawn and the vaginal wall incised for a short distance along the line of separation so effected. This is the method of incision described by Eden and Lockyer. The scissors are again introduced and now the points are kept closer to the under aspect of the vaginal wall. If this is done the scissors will pass *between the fascia* and the vaginal wall so that when the latter is divided the fascia will be plainly seen. This mid-line incision is continued to within 1 cm. of the urethral orifice. Each edge of the incision in the anterior vaginal wall is grasped with forceps and with the handle of the knife the fascia is completely separated from the under aspects of the two flaps (Fig. 2). The bladder is pushed up from the supra-vaginal portion of the cervix and the fascia is united over it by sutures which grasp it firmly and which cause it to overlap (Fig. 3). In the region of the neck of the bladder a firm bite of the fascia is taken with the needle well up towards the pubis a similar bite on the opposite side and the sutures tied. Two sutures placed in this way tuck the neck of the bladder up under the pubis and if a sound be now introduced into the bladder, it can no longer be made to sag away from this situation. In the region of the cervix the sutures which unite the fascia pass through the front of the supra-vaginal portion (the bladder being held up while the needle is passed), and so the bladder is prevented from slipping down on the cervix again. The redundant vaginal wall is cut away and the edges united with

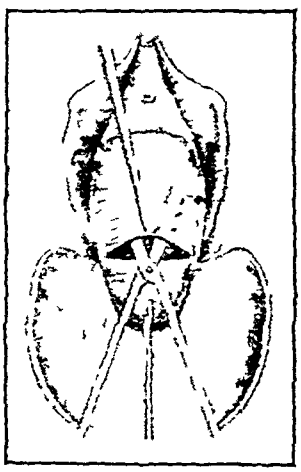

FIG. 1.—Cervix pulled down. Transverse incision at junction of cervix and vagina. Blunt scissors in section of anterior vaginal wall from bladder.

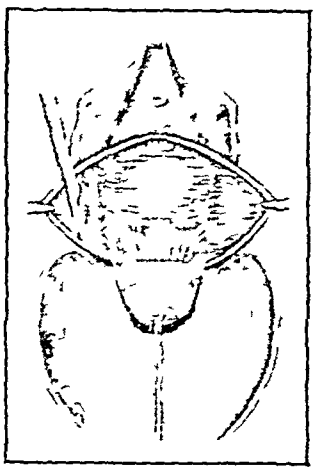

FIG. 2.—Anterior vaginal wall incised up mid-line. Fascia lifted from under surface with handle of knife.

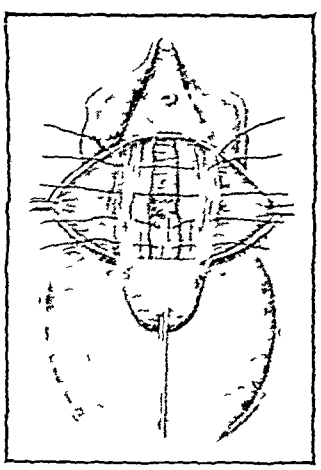

FIG. 3.—Fascia separated. Bladder pushed up. Overlapping sutures of catgut in fascia inserted. Note the deep grip of the upper suture. A second similar one is inserted but not shown.

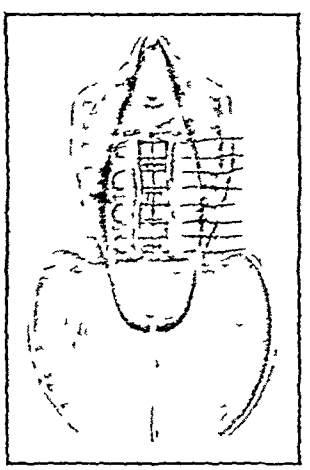

FIG. 4.—Fascial sutures tied. Excess of vaginal walls cut away and mattress sutures inserted.

mattress sutures and a superficial continuous one (Fig 4) Repair of the posterior pelvic floor is then performed

So far as the incontinence of urine is concerned, the important sutures are those which overlap the fascia at the neck of the bladder and so restore it to its normal position If these are *not* properly inserted the incontinence may persist in spite of the cystocele being cured If cystocele is *not* present it is not necessary to incise the whole length of the anterior vaginal wall The incision may be made in the mid-line over the neck of the bladder, and the fascia isolated and tightened by sutures

After such operations the patient almost invariably requires catheterization for some days, and it is often eight or ten days before she can urinate voluntarily Lately I have inserted a self-retaining catheter in all cases, leaving it in for four or five days

In none of the patients so operated on was there any return of the incontinence during their stay in hospital, but we cannot possibly judge the efficacy of the operation from that I accordingly sent a questionary to all the patients with urinary incontinence on whom I had operated up till six months ago The more recent cases were excluded as not affording a fair test The following questions were asked (1) Have you any frequency of passing water? (2) Have you any difficulty in holding the urine? (3) Does it come away when you cough or strain? (4) Are you better in this respect than before the operation? I received replies from 105 patients, with the following result

Perfect control	69 =	65 70%
Control not perfect but better than before	23 =	21 90%
No improvement	13 =	12 40%
	105 =	100 00%

The results are thus by no means perfect, but they are encouraging, and I feel can be improved by greater care in inserting the upper two sutures of which I have spoken The self-retaining catheter, I think, is also likely to do less immediate damage to the repaired structures than frequent catheterization, besides taking all strain off the sutures by preventing any accumulation of urine The results are better than I have got by any other means The upward displacement of the urethral orifice, twisting of the urethra, and similar operations do not get at the cause Kelly six years ago advocated a somewhat similar procedure which is described and modified by Graves The neck of the bladder is exposed and "several interrupted sutures of fine linen are then passed, picking up the ragged tissues on each side of the urethra at the level of its entrance into the bladder" Doubtless in that operation some of the fascia is grasped by the sutures, but much greater certainty in the results is got by freely exposing and defining the fascia in the way I have described The suture material I use throughout is catgut

DISCUSSION

The PRESIDENT regarded the subject of Professor Watson's paper as most important, especially as it was almost entirely neglected in the books His Cockney patients expressed their trouble vividly when they came up to hospital and complained that they 'jerked their urine" Members of the Section had all, no doubt, with a certain degree of success, but in a haphazard way, attempted to cure this condition, but Professor Watson had shown them how the pubo-cervical musculo-tendinous layer could be isolated and securely sutured

Mr MILES H PHILLIPS (Sheffield) could endorse all Professor Watson's statements The results of operative treatment on the lines laid down were extremely satisfactory, but there would always be a number of failures in those few patients in whom the fibro-muscular tissue had "perished" and would not hold sutures He agreed with the statement that want of full control was frequently associated with ordinary vaginal prolapse, although the patient did not always mention the fact unless confronted with the routine question, "Have you any difficulty in passing or holding water?" As regards prophylaxis, episiotomy was probably of value

Dr R W JOHNSTONE (Edinburgh) said that he had several times watched Professor Watson doing the operation which he described and had himself practised it It was a much easier thing than the description would perhaps lead one to think to isolate the pubo-cervical fascial layer which Professor Watson had described Like most gynaecologists, the speaker had usually been content to tighten up the neck of the bladder by means of a purse-string suture, but he was inclined to think that the technique which had been described was more anatomically correct and ought to lead to more uniform success in the treatment of the imperfect urinary control He entirely agreed with the writer of the paper as to the prophylactic value of episiotomy, particularly in primiparous breech cases in whom the perineum would otherwise always be torn An episiotomy incision obviated a great deal of difficulty in many cases and enabled a much more accurate coaptation of the cut edges to be made than in a ragged tear, with, as a consequence, a cleaner and stronger healing

THE INVESTIGATION, PATHOLOGY, AND TREATMENT OF UTERINE HAEMORRHAGE ABOUT THE TIME OF THE CLIMACTERIC

BY

JAMES PHILLIPS, F R C S EDIN,
Honorary Surgeon, Royal Infirmary, Bradford

THE three points which I desire to emphasize are (1) that *as regards pathology, in about* 25 *per cent of cases abnormal* bleeding is associated with malignant disease, (2) that as regards investigation, it is very desirable that the whole extent of the patient's complaints should be investigated, and (3) that as regards treatment, the endeavour should be to restore the patient to normal health and comfort

Pathology

I have analysed a series of 292 consecutive cases of women at or after the 40th year whom I have had in home or hospital on account of uterine haemorrhage, and I find *that* 61 of these were suffering from malignant disease *If* to these had been added the cases I had seen during the same period (1919 23) suffering from cancer so advanced that nothing could be done for them, the proportion of malignant cases would be not less than 25 per cent *In addition to the* 61 cases proved to be malignant, there were 50 cases in which the condition of the cervix was such as to make me advise that it should be microscoped For, of course, while it is not difficult to diagnose an advanced case of cervical cancer, there are many cervices, especially in early adenocarcinoma, where the masses of growth are in the substance of the cervix and little or no ulceration of its vaginal surface has occurred, in which a certain diagnosis by sight and touch is hardly possible during the early stage, when alone there is a reasonable prospect of radical cure If cancer of the cervix can be difficult to diagnose in its early stage, malignant disease of the body is still more difficult The trio of symptoms—bleeding, discharge, and pain—produced by uterine cancer are also present in most other abnormal uterine conditions, and at an operable stage the diagnosis of cancer of the body will almost inevitably depend upon the examination of curettings Just as difficult it is to diagnose early malignant changes in a fibroid

It is worthy of note how frequently myomata, which presumably have been present for a decade or more without giving rise to any symptoms of moment, will set up serious trouble about the period of the menopause This may be the result of—(1) change of position, (2) degeneration, or (3) malignant changes

1 *Change of position* —For example—

> Mrs G, aged 47, had had nine children the youngest 7 years old Menses quite normal until the age of 44, then menorrhagia commenced A fibroid was diagnosed, but an operation was declined until to the bleeding was added severe bearing down pain A tumour was found protruding through the well dilated cervix and was removed per vaginam It was a fibroid and weighed 14 lb

This patient recovered, but in two out of five cases of partially extruded fibroids sloughing and sepsis resulted in the death of the patient

2 *Degeneration* —The various non-malignant degenerative changes—cystic, necrobiotic, etc —are associated with reduced blood supply which makes the tumour more liable to infection, with consequent fever and pain

3 *Malignant Changes*.—Degenerative changes, both simple and malignant, are very likely to take place without giving rise to definite symptoms. Out of 94 hysterectomies for fibroids, malignant changes were found by the pathologist in five cases. In two of these the growth had invaded the bowel, necessitating enterectomy, and the bowel symptoms were the prominent ones. In two others the appearance of the tumour on section was the first indication that the growth was probably malignant. In one case only was a provisional diagnosis of probable malignancy made on account of pain and rapid increase in size.

In a sentence, then, malignant disease was present in 25 per cent. of cases of abnormal bleeding about the climacteric, and while still in an operable condition its diagnosis is frequently very difficult and often impossible without some operative procedure such as curettage.

Investigation

This should be begun by an endeavour to obtain a clear account of the patient's symptoms and the extent of her disability, in fact, an attempt should be made to arrive at an approximate diagnosis before beginning the physical examination of the patient. My first two questions are—(1) How long have you been ill? and (2) What was the first thing you noticed wrong? Then the patient is encouraged to give a consecutive account of her illness, irrelevancies being cut out as tactfully as possible and leading questions avoided.

It will be found in most cases that the bleeding is not the only symptom, commonly discomfort or pain also exists, the character and extent of which must be known if we are to be in a position to "cure" the patient. It is only in a minority of the cases that stopping the bleeding will alone suffice to make the patient a healthy comfortable woman.

I do not think any useful purpose would be served by discussing at length the details of a diagnostic bimanual examination. In all cases where the diagnosis is doubtful I wish to plead that instead of adopting the policy of "wait and see," the danger of incipient cancer should be explained to the patient, and some surgical procedure advised, either a diagnostic curettage, or the excision of the uterus, or of some part of it.

Treatment

The conclusion to which I have rather reluctantly been driven after twenty-four years' experience—the first ten years as a general practitioner, the remainder as an operating surgeon—is that hysterectomy is the safest treatment for a majority of the cases of menopausal haemorrhage, and also the one most likely to restore the patient to comfort and health.

I have indicated the difficulties in diagnosing cancer in its early stages, and could quote case after case in which the most experienced observers have been in doubt. At the very last meeting of the North of England Gynaecological Society, Mr. Miles Phillips showed a specimen of adenocarcinoma of the cervix where the diagnosis was uncertain before the excised uterus had been examined microscopically. Last year I saw a woman dying of a cervical cancer invading the vagina and involving bowel and bladder, who had been examined eighteen months previously by a well known gynaecologist and had been assured that she had then no sign of cancer.

In 1914 Dr. Eurich began a systematic examination for me of my hysterectomy specimens—an investigation which was interrupted by the war—and in two of these he found tiny nodules of cancer in the wall of the body of the uterus visible to the naked eye but which, had a diagnostic curettage been done, were so small that they might have escaped the curette or been too much broken up by it to permit a microscopic diagnosis to be made. This is what appears to have happened in one of my cases:

> Mr. T., aged 56, had by teretectomy performed and cancer of the body was found. Two years before curettage had been done by another surgeon and the curettings were reported to be innocent.

My first reason, then, for suggesting radical treatment in cases of menopause bleeding is that many of them are potential cancer cases, and that removal of a useless and unhealthy organ will relieve the patient from the menace of a painful illness and a miserable death.

There is a further reason for advising hysterectomy in a large proportion of these patients, which is that they are suffering from symptoms which nothing short of radical treatment is likely to cure. Function and not anatomy is the important consideration. The question to be decided is what is the least extensive and risky procedure likely to make the patient as functionally normal as possible. The operation required may be as simple as a curettage or the removal of a cervical polypus. An eroded or pulpy cervix may be cauterized (in my experience much more effective than curette and caustic) or excised, and where prolapse is present a colpo-perineorrhaphy may be done.

Yet, as will be seen from the table of cases I have performed hysterectomy in 201 of my 292 patients. In a considerable proportion of these there was no reason to suspect cancer, and the radical operation was suggested to the patient because it was thought that a less complete operation was not likely to "cure" her. Frequently there was old tubo-ovarian disease, or a more or less disabling degree of pain was associated with the dragging of a heavy and often tender uterus. For example—

> Mrs. C., aged 42, the widow of a civil servant, had since his death attempted to keep herself and her two children by taking in boarders. She suffered from menorrhagia, backache, and bearing-down pains which by treatment each day almost incapacitated her. She consulted a physician who referred her to me. I removed a heavy uterus of the so-called metritic type. Within four months of the operation she was able to take a post as matron of a home at a boys' preparatory school and reported herself as being better than she had been for years and quite free from the old backache and pain.

In cases such as this the menorrhagia is only part, and perhaps a minor part of the disability; treatment, such as by radium, which may control the bleeding will not thereby make the patient a useful, happy member of society. We have no radium available at Bradford Royal Infirmary. Had we had a radium department I think perhaps at most twenty-five of my cases (those where bleeding was the essential symptom) might have got quite well without radical operation, but in the others there was either cancer (actual or potential) or a condition other than the bleeding sufficient to produce some degree of invalidity.

Three years ago I operated on a lady who suffered from prolapse and menorrhagia, doing a perineorrhaphy and excising a considerable wedge from a heavy metritic uterus. The prolapse is cured and the menses are no longer excessive, but the patient who is well over 50 years of age still has considerable malaise with each period, and is sometimes an invalid for two or three days each month. Had I performed hysterectomy three years ago I think she would long ago have become an entirely healthy woman.

Dr. Fletcher Shaw, after quoting Henry Bennett's description of the women suffering from chronic uterine inflammatory disease, most of whom would, if their disease were only discovered and cured, eventually recover their health, spirit, and powers of locomotion, writes: "A very large proportion of them give a long history of symptoms, generally dating from a pregnancy, but it is often only after years of medical treatment and when nearing the menopause, that these symptoms become so severe as to necessitate an operation." Such a patient is likely to wish beyond all else that what is done shall if possible be final; the notion that women have a strong inherent sentimental objection to losing the womb has not been borne out in my experience. Given the choice of a minor operation which possibly may relieve her and a hysterectomy which is very likely to cure her and will certainly rid her of an unhealthy pain-producing organ, the almost invariable reply I get is:

> I want to be made well and please don't leave anything which isn't healthy behind."

All of us who specialize tend to become obsessed by our specialism and to look for more. Fortunately for our patients perhaps it is the general practitioner whose advice is sought and who decides which specialist shall be asked to deal with the case. The general practitioner will try a new method or treatment for a time, but will only continue to advocate it if the results are good; he has opportunities to note its success or failure over long periods. I can only refer to the lot of the specialist. It was my own experience in general practice which disappointed me with the results of [illegible] bleeding. I am [illegible] partial opera[illegible]

encouraged to continue hysterectomy by the fact that the family doctors—including some who refer work of other kinds to other surgeons—continue to send patients to me for hysterectomy, not infrequently expressing in their letters the hope that I will "make a clean sweep"

ANALYSIS OF 292 CONSECUTIVE CASES

Fibroids 102
- Curettage 1
- Removal per vaginam of partially extruded fibroids 5 (2 died)
- Removal per vaginam of malignant fibroid 1 (died)
- Hysterectomy 94 (of these 5 were malignant and 6 were reported to be "degenerating") (1 died)
- Exploratory laparotomy (malignant—inoperable) 1

Degenerative changes in uterus (for example, chronic metritis, fibrosis, glandular endometritis) 57
- Removal of adnexa only (ovario salpingitis) 4
- Hysterectomy 53 (2 deaths) (2 cases were associated with adherent ovarian dermoid, 4 with cystic disease of the cervix, 21 with chronic adnexal disease)

Cervix suggesting commencing cancer 50
- Local excision 4
- Local excision with colpo perineorrhaphy 16
- Hysterectomy with colpo perineorrhaphy 3
- Hysterectomy (where suspicious cervix was associated with some other pathological condition—for example, pyometra, adnexal disease, tender and painful fundus) 27 (1 died)

Cancer of body (hysterectomy) 5

Cancer of cervix 49
- Hysterectomy 13 (? died)
- Local treatment of inoperable growth 34
- Referred to radiotherapeutist 2

Polypi presenting at os uteri 21
- Local excision 15
- Hysterectomy 6

Subinvolution, endometritis, etc (curettage) 5

Declined operation 3

DISCUSSION

DR J J BELL (Bradford) acknowledged that what Mr Phillips had said was based upon the results of his own personal experience He himself, in the course of his work, had found that many of these cases could be cured without the necessity of a severe major operation The profound exhaustion of many of these patients after prolonged bleeding could be markedly improved by rest in bed He confined his remarks to those cases of menorrhagia and metrorrhagia which presented no obvious gross lesions requiring drastic treatment They had a small amount of radium at the Samaritan Hospital, and ten to twelve hours' application of radium would completely cure all cases of excessive haemorrhage which presented no gross pathological growth He felt certain that conservation of the uterus was a comfort to the patient Radium would completely cure bleeding in cases of uterine fibrosis where repeated curettings would not He had known of complete recovery with radium treatment in cases where recurrence in the vaginal vault had followed panhysterectomy for cancer

DR J J HOLLAND (Western Australia) referred to the alarming increase in the incidence of cancer in Australia, and stated that a recent conference of experts in Melbourne had condemned radium treatment outright Patients had been known to clear up after exposure to radium, and then to come back in a few months' time in a worse condition than before He would like to ask how long expectant treatment ought to be followed A very small growth in the cervix might have extensive intraperitoneal deposits which could only be discovered by opening the abdomen Curetting was probably useless He strongly condemned delay in the radical treatment of unnatural haemorrhages and advocated complete hysterectomy, as it could do no harm and made the patient much more comfortable

Professor B P WATSON had difficulty in arguing for or against hysterectomy in cases of climacteric haemorrhage, because treatment must be based on accurate diagnosis Such a diagnosis should be obtainable with the patient under an anaesthetic, when, on careful bimanual examination, it ought to be possible to determine the size, shape, and consistency of the uterus, and any abnormality in the appendages If, on such an examination, the uterus was found to be of normal size or only slightly enlarged, the appendages normal, and the results of the curetting negative for malignant disease, radium should offer the best and safest line of treatment On the other hand, if there was a badly lacerated, hypertrophied, and catarrhal cervix, if the uterus was very heavy, metritic, and displaced backwards and downwards, or if there was disease of the appendages, the patient's symptoms might not be relieved by mere stopping of menstruation In such cases he would certainly advocate hysterectomy, and did so constantly in cases of marked prolapse with a uterus as described If vaginal hysterectomy was performed and the operation completed according to the Mayo technique, an extensive pelvic floor repair being done, the results were, in his experience, much better than those obtained by any other means

MR MILES H PHILLIPS also stressed the absolute importance of diagnosis as the only sound guide to treatment Cases of simple "chronic metritis," or chronic subinvolution, could be certainly cured with radium if used in sufficient quantity (2,000 milligram-hours) Apart from these cases his bias was, with Mr James Phillips, strongly in favour of total hysterectomy, especially when the cervix was lacerated or chronically inflamed If there was vaginal prolapse this could be cured at the same time by the modern plastic operation after removing the uterus by the vaginal route

MR GORDON LUKER agreed with the previous speaker as to the importance of accurate diagnosis of the cause of the bleeding before deciding on the treatment suitable to the case He was satisfied that curettage, if properly carried out, could be relied upon to produce evidence of malignant disease where such existed He always used a tent before curettage, if possible, in order that the cervix might be dilated sufficiently to allow digital exploration and a thorough scraping of the uterine cavity If carcinoma of the body and cervix was excluded, he placed his cases for treatment in three classes—mild, moderate, and severe If the bleeding were only mild he found that some were cured by curettage followed by the administration of pituitary extract and calcium lactate In cases of moderate severity he found radium almost a specific, using 100 mg for twenty-four hours In severe cases where much anaemia was present he thought that hysterectomy was the best treatment This was also indicated when the uterus was much enlarged by chronic metritis or by one or more small fibroid tumours, when severe chronic cervicitis was present, or when there was coexisting disease of the adnexa He was doubtful whether it was necessary to remove all the pelvic organs in young women suffering from adenomyoma of the uterus or one ovary He was not familiar with cases of recurrence of the condition after the primary focus had been removed Seeing that the disease was not malignant he had up to the present made a practice of conservative methods when operating

MR W W KING (Sheffield) thought that cases of menorrhagia without gross pathological changes could be readily cured by radium, although he had experienced a few failures, bleeding returning after the first application In cases of metrorrhagia—excluding such simple pathological changes as polypi—it was far better to remove the uterus rather than to delay, waiting for a pathological report It was a matter of very great difficulty to determine malignant changes in curettings, and, knowing this, the pathologist would always tend to err on the side of safety When the report had been received the patient might refuse a second operation, and the fallacious impression was left that curetting could cure cancer

THE PRESIDENT thought that the "investigation" part of Mr Phillips's paper was the part which had been least emphasized in the discussion Undoubtedly the first thing to do in all these cases was to examine them very thoroughly, whenever possible inserting the gloved finger inside the uterine cavity He agreed that it was difficult to be certain whether cancer was present or not in curettings He would like to utter a word of warning against the use of terms like "precancerous" or "potential cancer", they were bringing trouble upon themselves

in using them There was no doubt that radium had done an enormous lot to cure cases where nothing obviously surgical had been discovered, but he thought they were still rather vague about the question of dosage He used 100 m_g exposure for twenty-four hours, or 50 m_g exposure for forty-eight hours, in cases of cancer Radium employed before operation enormously diminished the chances of implantation recurrence taking place

THE ADVISABILITY OF A ROUTINE PELVIC EXAMINATION DURING THE PUERPERIUM

BY

MILES H PHILLIPS, M B, B S, F R C S,

Professor of Obstetrics and Gynaecology University of Sheffield

ANTE-NATAL examination is nowadays, and quite rightly, attracting much attention, this is in accordance with the modern desire to promote preventive medicine With the same object in view it is very desirable that a thorough pelvic examination of the mother should be made during the puerperium—before she is permitted to return to ordinary life In this way many of the diseases which occupy the gynaecologist's attention, and which result from the wear and tear of parturition, may be caught in their earliest stages, when they are so much more amenable to treatment

Twenty years ago I commenced to make a routine examination on the twelfth day of the women who had been confined in the Jessop Hospital, Sheffield, ever since then I have paid special attention to this examination and have become more and more impressed with its value During the same period, in both consulting and hospital practice, I have met with a very large number of patients who would have greatly benefited had such an examination been made

On inquiry I have found that very few family practitioners make such an examination They generally say that they were not taught to do so Some think the patients might resent it, there, I believe, they are wrong The practice appeals to women as a very sensible one, and I have *never known a patient demur On the other hand*, I have often found it difficult to explain away the fact that an examination had not been made before Well trained nurses nowadays also realize its value, and prepare the patient's mind by pointing out the advantages of knowing whether or not everything is all right

The best time to make the examination is, I think, about the twelfth or thirteenth day, this is a day or two before the hospital patient goes home, or just before most of us allow our private patients to walk about the bedroom Should anything abnormal be found demanding more rest and care the patient is thus saved the disappointment of being ordered back to bed Originally I was more or less compelled to choose this time by the exigencies of hospital practice Later I realized that the state of the lochia, the size of the uterus, and condition of the cervical canal render it the most suitable time

The examination should be a thorough one of inspection and palpation—not simply a perfunctory search for the presence or absence of retroversion of the uterus, which is by no means the most frequent or important departure from the normal The bladder and lower bowel having been emptied, the patient is carefully placed in a correct Sims's posture with the buttocks opposite a good light The doctor's hands and the patient's vulva are prepared as if for an examination during labour *The perineum and vulva* are first inspected Then a Sims's speculum of suitable size is chosen and inserted, and the nature of any discharge and condition of the vaginal walls and of the cervix is investigated As will be seen later, certain abnormal states will require treatment which can be carried out at once The speculum is now removed and digital palpation of the vagina, pelvic floor, and cervix is made the patency of the cervical canal is also ascertained Normally by the twelfth day the internal os will not admit the forefinger, occasionally it will do so and then with the assistance of the left hand on the lower abdomen it is possible to explore the cavity of the uterus Finally, the position and size of the uterine body can be ascertained by bimanual examination, and inflammatory or other extrauterine swellings sought for

Amongst the most common lesions to be discovered are incompletely healed lacerations It is obviously a simple duty to inspect a repaired perineum or vaginal outlet to see if it has completely healed Tears may, however, also occur, and even in unassisted labours, in the upper vagina often these are not immediately found and sutured They heal by second intention, not seldom with the formation of granulation tissue, which may proliferate to form granulation polypi of considerable size These, when found, can be painlessly snipped down with scissors and destroyed with pure carbolic acid If neglected they may produce a discharge for which I have known patients to be fruitlessly douched for many weeks Such granulations are, however, more commonly seen in the angles of a lacerated cervix, here they may be sessile or polypoidal They cause discharge and readily bleed, they may persist for years, but are readily and painlessly cured with a pair of curved scissors and a strong caustic—the earlier the better If neglected they help to form the chronically inflamed ectropion of the cervix, which is the result of an infected cervical laceration This is a very common and troublesome disease, generally not seen by the gynaecologist until many months have elapsed The cervix may then be beyond recovery and have to be amputated more or less completely In the puerperium the condition may be cured by the simple measures I have already indicated In this connexion I must refer to those tragic cases of rapidly growing carcinoma of the cervix occurring soon after parturition I have seen them advanced and inoperable within so few months of the last labour that there seemed to be no doubt that the disease must have been present and recognizable during the puerperium Unfortunately, the bleeding and discharge produced by the growth had been thought to be of no special importance so soon after labour

Delayed involution of the vaginal walls and pelvic floor will be recognized easily by one who, accustomed to these examinations, is aware of the variation in the rate of involution of these structures It is the only way in which he can obtain a normal standard by which to judge suitable treatment in these early days will lessen the incidence of vaginal prolapse The degree of involution of the uterus is estimated on bimanual examination and is conveniently standardized by comparison with the size of the pregnant organ On the twelfth to fourteenth day it is usually slightly larger than the uterus at two months In a number of cases where the uterus is larger than it should be one will find the cervical canal patulous, the internal os easily admitting the forefinger The cavity of the uterus can at once be explored, the left hand being used to press the fundus and body of the uterus downwards towards the exploring finger In this way the uterus has occasionally been found to contain one or more rounded nodules lightly adherent to the lining membrane These it is usually easy to separate with the finger and occasionally one can hook the piece with the finger through the cervical canal Usually, however it is necessary and better to wash or scoop them out by means of a large flushing scoop and a stream of hot lotion For this the patient should preferably be put in the lithotomy position Very rarely is any more than slight bleeding so caused It is only in the case of a very nervous woman that anaesthesia is required at this stage of the puerperium whereas later on an anaesthetic is necessitated by the need for instrumental dilatation of the cervix Microscopical examination of these nodules has usually shown decidual tissue only, surmounted by *organizing blood clot* they might be described as "decidual" rather than 'placental polypi' In any case they are to be distinguished from masses of retained placenta which usually cause serious haemorrhage and other symptoms at an earlier date

Lochiometra and Endometritis—In some cases lochia will be found to be pent up in the uterus it is then useless for the organ to be unduly anteflexed, though it may be retroverted In either case it should be straightened by suitable pressure with the fingers, this will result in a gush of fluid from the uterus—either turbid serum or muco-pus—an indication that drainage from the uterus is defective The uterine cavity should in these cases be irrigated with a suitable antiseptic solution, and this may have to be repeated on more than one occasion, sometimes

it is an advantage to introduce a drainage tube, or the cavity may be swabbed out with suitable antiseptics Such retained lochia may be found to contain pathogenic organisms, and I suspect that this is an early stage in the development of that form of chronic metritis which leads to chronic subinvolution—a far too common gynaecological disease A rise of temperature, often only slight and not above 99° F, not infrequently accompanies this condition of lochiometra In not a few of these cases the offending organism is the gonococcus, which is prone to spread from the cervix to the uterine cavity after parturition Prompt and thorough treatment at this stage should prevent the onset of salpingitis and pelvic peritonitis, as well as of chronic metritis

Retroversion.—Retroversion of the uterus will be found in a small percentage of these women at this stage, the uterus should be fully replaced and held so by a pessary—preferably a broad Hodge In primiparae there is a considerable chance of permanently curing the displacement in the course of the following three or four months, during which involution of the uterine supports appears to continue As involution of the vagina progresses it is usually necessary to lessen the size of the pessary once or twice before the test of leaving it out is made Retroversion may, however, not occur until the third or fourth week—I have never known it do so later—and knowledge of this has led me to make a second examination of my private patients towards the end of the fourth week, some day I hope this will also be practicable for hospital patients These statements about retroversion will be of interest only to those who recognize that retroversion may cause much pelvic discomfort, and in some patients is a cause of sterility, in others of repeated abortions Having convinced myself that this is so, I strongly advocate making the attempt to cure the condition by simple pessary treatment

Such are my chief reasons for advising a routine examination during the puerperium One other has been omitted which is not the least important—the satisfaction of those fortunate patients to whom one is able to announce that "everything is all right"

DISCUSSION

DR MCGREGOR YOUNG (Leeds) stated that a routine examination was made of all patients at the Leeds Maternity Hospital at the time of their discharge from the hospital, usually from the twelfth to fourteenth day after delivery Notes were taken as to malposition of the uterus, and of 1,000 consecutive cases retroversion was found in 50 cases—that is, 5 per cent Previously it had been the practice where such malposition was found to insert a pessary, but it was determined to try what the result was without any support In this 1,000 cases nothing was done, and the patients were discharged without remark—that is, no suggestion was made to the patient that anything abnormal had been found Most of these women attended at intervals later At the end of six months these 50 cases were asked to attend, and 32 came for re-examination Of these 32 retroversions 30 were found to be normal and anteverted—that is, 93·7 per cent, only 2 remained retroverted—one from a cause not apparent, the other in consequence of several fibroids in the posterior wall of the uterus

The above observations were made prior to January 1st, 1924, and reported to an obstetrical society Since that time similar notes had been taken in 748 cases more Among these, 42 cases of retroversion were found—that is, 5·6 per cent Only 14 of these had completed a six months' interval from delivery, and of these 14 only 8 responded for re-examination, 7 were found normal and one persisted in the retroverted position This latter was a 12-para, and had probably suffered from retroversion before her pregnancy

A careful search was made for the possible causes of the retroversions in these 1,748 cases, especially for any lesion which might lead to subinvolution, which was considered the probable antecedent to the retroversion, such as sapraemia, pelvic inflammation, pelvic tumours, excessive haemorrhage, prolonged labour, and retained portions of placenta The results were as follows: of the 92 patients with retroversion, in 60 patients there was a perfectly normal puerperium 14 showed a mild sapraemia, 4 had placenta praevia with haemorrhage, and 2 had undue haemorrhage The remainder had prolonged labour or malpresentations, or required manipulative interference

This report was thought of interest in view of the facts that it was a common routine in most maternity hospitals to insert pessaries for retroversion, and it was the common teaching in most textbooks that such treatment is the correct procedure

DR R W JOHNSTONE (Edinburgh) said that the title of Professor Miles Phillips's paper had not led him to expect the description of such an elaborate method of examination as the writer appeared to practise In the Edinburgh Maternity Hospital then practice was to examine all patients before they were discharged, generally about the tenth or twelfth day, but in private practice he preferred to postpone the examination until about the end of the third week The routine examination involved merely inspection of the perineum, bimanual examination to detect cervical tears, and the position of the uterus The speculum was never used unless there was some definite indication for it, and he confessed that he felt considerable doubt about the wisdom of introducing the finger into the uterine cavity as Professor Phillips had described With regard to retroversion of the uterus, it had been his practice, if he discovered a retroversion at the end of the third week, to leave the condition alone for another three weeks or a month, asking the patient to return at that time In a large number of the cases the displacement was found to have been spontaneously rectified at the end of six weeks, as had just been described On the other hand, a retroversion was occasionally found to be present in patients at the end of six weeks which had not been present at the end of three weeks Rectification and the introduction of a pessary at the end of six weeks still held out good hope of cure, since the impetus to involution had not yet exhausted itself

PROFESSOR B P WATSON (Edinburgh) agreed *cordially* with all that Professor Miles Phillips had said It had been his practice for a good many years to carry out a routine examination on his puerperal patients on the twelfth day, and again four weeks after delivery He had frequently found that a uterus in normal position on the twelfth day was retroverted at the end of the fourth week At whatever time he discovered the retroversion he replaced it and inserted a pessary In one or two cases he had replaced without inserting the pessary, and found that they remained in good position He would not have the courage to do this, however, unless he were to have an opportunity of seeing the patient at frequent intervals As a routine he believed that it was better to replace and put in a pessary in all cases His examination had not gone so far as that of Professor Phillips in that he had been content with an inspection of the perineum and a careful bimanual examination Unless there were special indications, such as Professor Phillips had mentioned, he did not make a routine examination with the speculum He had said elsewhere that, as ante-natal care was preventive midwifery, so post-natal care was preventive gynaecology Now that the value of ante-natal care was fully recognized he thought that the importance of post-natal care must be impressed upon the profession also

MISS FRANCES IVENS (Liverpool) supported Professor Phillips in his plea for routine pelvic examination in the puerperium The out-patient departments were crowded with the results of the untreated traumata of labour Not only would a retroversion be found in a certain number of cases, but frequently also a laceration of the cervix, even where there had been no instrumental delivery Latent unrecognized gonorrhoea was also responsible for a certain number of puerperal infections With a routine post-natal examination this would be discovered before the patient got up, and acute exacerbations might be averted Miss Ivens did not herself employ such a detailed technique as Professor Miles Phillips advocated

PROFESSOR MILES PHILLIPS, replying, said he did not attach importance to statistics in such matters If was the

individual patient who wished to be cured of her retroversion, by simple means if possible. It was not known which cases would cure themselves spontaneously. With regard to digital exploration of the puerperal uterus, the special indication was a patulous condition of the internal os on the twelfth day. With proper precautions he had found it free from any danger. He was glad to hear that Miss Ivens agreed with him in starting treatment for gonorrhoeal cervicitis and endometritis at this early stage in the puerperium. He hoped that teachers would find it possible to give practical instruction to medical students in this special form of examination.

THE CLINICAL SYMPTOMS OF PELVIC ADENOMYOMATA

BY

W. W. KING, M.B., F.R.C.S.(EDIN.),

Lecturer in Gynaecology, University of Sheffield; Honorary Surgeon, Jessop Hospital for Women, Sheffield.

SINCE the first *detailed account of adenomyoma, which was* published by *von Recklinghausen in* 1893, *numerous* cases have been recorded. Most important additions to our knowledge of the pathology of these strange neoplasms have been contributed by Cullen, Loeb'er, and Sampson, but their clinical aspect has not received so much attention. They are, essentially, tumours composed of glandular tissue which has the histological characteristics of the epithelium lining of the uterine cavity. These glandular elements are surrounded by a varying amount of non-striped muscle which in some cases forms the greater part of the tumour, while in others it is scanty or entirely absent.

When fully developed and unmodified by growth the glands and stroma are not only identical with those of the endometrium, but have the same physiological powers. Theodore Doderlein has recorded a remarkable instance of pregnancy within the cavity of an adenomyoma which chanced to be connected with the uterine cavity by a narrow isthmus. This is a pathological curiosity, but menstruation and a decidual reaction during pregnancy regularly take place within these tumours. The symptoms of pain and vomiting are dependent upon the congestion and tension set up by the effusion of menstrual blood *into the endo*metrical islets, each of which thus becomes a miniature haematometra.

Most fascinating theories have been evolved to account for the presence of *functionally* active endometrium in such diverse and remote situations as the uterine wall, the ovary, the rectum, and the stomach. These growths may arise from some developmental error, or from a downgrowth of the peritoneum, or, as Sampson has suggested, from the accidental implantation of epithelium from the tubes. The interest of these etiological questions is so intriguing that attention has been focused upon them rather than upon the actual manifestations of the disease, in other words, the problem has been an interesting by-path to the pathologist, but somewhat of a *terra incognita* to the clinician. There are, however, *recognizable symptoms* upon which a preoperative diagnosis can be made, and within the abdomen the appearances are often very characteristic, though sometimes easily missed if not carefully looked for.

The facts upon which this paper is based have been extracted from a detailed analysis of 122 cases upon which I have operated. One patient had two operations (the first a simple excision and the second a hysterectomy), so that there were in all 123 operations. All the cases have been proved to be adenomyoma by histological examination, with the exception of six of the earlier specimens of advanced growths in the recto-vaginal space, *which* were so typical that sections were not cut. I may here express my indebtedness to Professor J. S. C. Douglas and his staff in the pathological laboratory for their examination of the large amount of material which I have submitted to them during the years which have been covered by this investigation.

An intelligible classification based on the anatomical position of the tumours has been a matter of some little difficulty owing to the fact that they are often multiple and that they frequently invade *one or more* adjacent organs. In order, therefore, to avoid a confusing list of subdivisions the grouping has been formulated according to what appears to have been the main or primary lesion. Upon this basis the growths and their frequency may be classified as follows:

Recto-vaginal space	52 cases
Peritoneum	26
Ovary	23
Uterus	17
Tube	4

CLINICAL SYMPTOMS

There were no apparent symptoms in just over 16 per cent. of the cases, including one (aged 64) who was past the climacteric. The growths in these cases were found at *operations undertaken for other* condition.

Age.—Endometrial new growths may be found at any age, the youngest patient of this series was 20 years of age, and the oldest 64. The climacteric may be delayed, but, when it is established, the growths atrophy like the uterus.

Sterility.—Patients who suffer from adenomyoma appear to be specially prone to be sterile. Many patients of this series had never been pregnant, and others had not borne a child for eight to ten years.

Abdominal Pain.—This was the most common complaint and was recorded as being present in 63 per cent. of the patients who had symptoms. It was generally described as a "shooting," "gripping" or "aching" pain situated in the lower abdomen, but in a few rather misleading cases the pain was entirely confined to the epigastric region. Most, but not all of the patients complained that it was worse during menstruation, so that this association may form a useful clue in the investigation of *abdominal* pain of uncertain origin. The onset of the pain was often acute and accompanied by vomiting and had thus not uncommonly simulated appendicitis, renal colic, or gall stones, and operations had been advised or undertaken for these conditions. Generally speaking, however, the pain was described as being more or less continuous, though liable to exacerbations.

Vomiting.—Nausea or vomiting very frequently accompanied menstruation, but 26 per cent. of the patients also complained of these symptoms between the periods. The vomiting appeared to have *no relationship* to the intake of food.

Dysmenorrhoea.—Dysmenorrhoea is one of the classical symptoms of adenomyoma, and, in the series, it was recorded as being "very severe" in nearly half the case. On the other hand 25 per cent. of the patients had either no pain or but slight discomfort during menstruation. The records as to the details of the pain are unfortunately, rather incomplete, but it was generally of the spasmodic type. Nausea and vomiting were present in 17 out of the 58 patients concerning whom there is positive information (29.3 per cent.)—*it is noteworthy* that in 8 out of the 17 the growths were in the ovary. Similarly 15 out of 40 (37.5 per cent.) complained of rectal pain during the period, and of these 15 patients 10 had growths in the recto-vaginal septum. These figures suggest that vomiting is a symptom of ovarian growths and rectal pain of those in the recto-vaginal space, but the figures are not large enough to warrant such a deduction. The most striking feature of the dysmenorrhoea is its sudden onset in a patient who has previously been free from pain. This feature is so characteristic that when present it at once suggests the diagnosis of adenomyoma, and the clinical picture is almost complete if there is rectal pain or vomiting. The absence of these symptoms does not, of course, exclude adenomyoma for, as has been stated above, quite a considerable proportion have a negligible amount of pain during menstruation.

Menorrhagia.—It is difficult to say to what extent adenomyoma is a cause of menorrhagia. It was present in 52 per cent. of the patients with adenomyoma of the uterus, and, in the absence of any other apparent cause the haemorrhage may be presumed to be a result of the new growth. Twenty-five per cent. of the patients with extrauterine adenomyoma also had an increased menstrual loss without any gross pathological change to account for it. But in view of the numerous causes of menorrhagia with an apparently normal uterus, these figures do not justify the assumption that there is of necessity any causal relation-

ship between the two The occasional occurrence of metrorrhagia may be regarded, likewise, as perhaps due to some unknown functional cause

Dyspareunia —There is only an actual record of dyspareunia in just over 8 per cent of the cases, but there can be no doubt that it would have been much more frequently recorded if it had been desirable to make routine inquiries concerning it The growths in the recto-vaginal space were especially prone to cause this symptom

Rectal Pain —Intermenstrual pain in the rectum was complained of by 15 per cent of the patients, most of whom had growths in the recto-vaginal space The pain was sometimes shooting or spasmodic and somewhat of the type common in an anal fissure The pain was more severe during defaecation, and was occasionally only felt during this act There appeared to be a tendency to increasing constipation in some instances, but in no case was there any actual obstruction

The Physical Signs

The physical signs of adenomyoma are only characteristic when the growth is in, or adjacent to, the recto-vaginal space Adenomyoma of the corpus uteri, if large enough to be palpated, is indistinguishable from a myoma The physical signs of a tubal growth are equally equivocal Firmity and extreme tenderness of an ovary will at times help to confirm a diagnosis already suggested by the history, but tumours in more remote positions do not give palpable evidence of their presence Tumours in the region of the recto-vaginal space, on the other hand, do cause very typical physical signs In this situation the commonest and most diagnostic sign is a tender retrocervical thickening A palpable swelling was found in this position in 63 per cent of the recto-vaginal growths There may be a localized nodule, but more commonly there is a bar or ridge which can be felt through the posterior fornix traversing the cellular space bounded by the peritoneum, the rectum, and the posterior vaginal wall Sometimes the ridge is wedge-shaped with the base up, and closely resembles the finger flexed at the first interphalangeal joint In some cases actual blood cysts may be seen through the mucosa of the posterior vaginal fornix, or, in some rare cases, actual adenomatous polypi, identical with the so-called mucous polypi of the uterus, may project through the fornix into the vagina

Thickening and tenderness of the utero-sacral ligaments is a most valuable sign, which is best elicited by rectal examination These ligaments are, of course, often thickened in parametritis, but the sensitiveness to pressure is not so acute, and, in any case, in inflammatory effusion can be readily improved by a course of suitable treatment, but this will not influence an adenomyoma The only other common cause of induration of the utero-sacral ligaments is a malignant growth of the cervix or rectum The former can be recognized without difficulty, but the latter may be easily confused with adenomyoma, which quite commonly invades the rectal wall In this series the rectum was involved to some extent in 24 out of the 52 cases of adenomyoma of the recto-vaginal space (that is, 46 per cent) The extent of the invasion of the rectum is shown by the fact that its lumen was opened in 11 out of the 24 cases Sometimes large areas of the anterior rectal wall had to be excised, and in one case so extensive was the growth that three inches of the rectum was removed and an end-to-end anastomosis performed Rectal examination in a well advanced case discloses a hard, tender, craggy mass in the anterior wall The physical signs are therefore similar to those of carcinoma of the rectum, with the exception that the rectal mucosa remains intact Ulceration of the mucous membrane over the growth may occasionally take place, but it was not noted in any of the cases covered by this review

A tender adherent retroversion was found in 21 per cent of the cases, so that the presence of this sign warrants a careful consideration of the whole position before operation is undertaken, lest a major operation may have to be performed upon a patient who has not been warned of any such possibility This unpleasant predicament occurred several times in this series, so that a warning to others may not be out of place

Morbid Anatomy

Recto-vaginal Space —In this situation the growths may vary in size from that of a pea up to large masses which obliterate the pouch of Douglas They often appear to grow from the back of the supravaginal cervix, and from thence to spread out laterally into the utero-sacral and the broad ligaments, and backwards into the rectum Very frequently the bowel is characteristically puckered on to the posterior uterine wall, and thereby the uterus is retroverted The growth in the bowel tends to be situated in the anterior wall, and very often by careful dissection it may be excised without opening the lumen of the bowel, for it does not involve the mucous membrane

Peritoneum —In these cases laparotomy disclosed a varying number of black or dark blue cysts occurring singly, or more commonly in groups scattered over the pelvic peritoneum Individual cysts may vary in size from that of a pin's head up to that of a millet seed, they can often be most easily recognized by palpation, and are very prone to lie on the back of the broad ligament under cover of the ovary Stellate scar-like areas are also seen, which probably represent adenomyomatous implants which have healed owing to the destruction of their lining epithelium from intracystic pressure Occasionally clear, firm cysts, with tiny projecting horns, may be noted, and more rarely the peritoneum is thickened so as to present a sort of pig-skin appearance

Ovary —Ovarian adenomyomata are most easily recognized when they contain cysts filled with chocolate-like fluid These may be tiny black cysts on the surface of one or both ovaries, or they may form large "chocolate" cysts which completely fill the pelvis The ovary may appear to be normal, except that it is adherent to the back of the broad ligament or to the floor of the pelvis, but on separating it the typical chocolate-like fluid escapes In some cases no macroscopic change may be found, and in these the diagnosis can only be made on histological examination

Uterus —Adenomyomata of the uterus closely resemble fibroids, but they are not encapsulated, and are frequently situated near the cornu

Tube —Tubal adenomyomata occur as definite localized tumours projecting from the tube, and are generally situated in the region of the isthmus

Results

Four out of the total cases died as a result of the operation—a mortality of 3·2 per cent

In order to obtain a fair conception of the operative results, only those patients have been written to who were operated upon prior to 1924, and from these 103 patients 86 replies have been received It is only necessary here to give the general conclusions brought to light by the replies These may be summarized as follows

1 Hysterectomy with removal of the ovaries cured all but one of the 57 patients who replied

2 Hysterectomy without removal of the ovaries cured all the 7 patients who replied But in one instance I have had to remove painful ovaries left after vaginal hysterectomy, which, after removal, were found to contain adenomyomatous blood cysts, so that it is probable that these figures would be modified in a larger series of cases

3 Excision of the growth without hysterectomy does not give such good results Only 13 out of the 22 patients who replied recorded a complete cure

The small *localized* adenomyomata can be successfully treated by conservative measures, but the more extensive growths require hysterectomy irrespective of the age of the patient

The Relationship of Adenomyoma to other Conditions

Inflammation —In so far as inflammation may have a bearing upon the causes of the disease, it is interesting to note that *39·7 per cent of the patients* had a history with physical signs of some inflammatory process The cause of the inflammation, as nearly as can be ascertained, were as follows

Tuberculous	11·9 per cent
Gonococcal	11·6 "
Pelvic abscess or septic confinement	13·2 "

Myomata.—These tumours were present in 22 per cent of the cases

Malignant Growths.—As a contribution to fact and without drawing any conclusions, I may record the following cases in which a malignant growth was associated with adenomyoma

1 Two patients had carcinoma of the cervix
2 Three patients had adenocarcinoma of the endometrium
3 One patient had carcinoma of the sigmoid
4 One patient is reported to have died of carcinoma of the *rectum four years after* I had performed a hysterectomy for adenomyoma of the uterus

DISCUSSION

Professor B P Watson said he did not think many could have had such an extensive experience of adenomyoma of the pelvis as Dr King, who had brought out very clearly the important clinical features of these cases What had struck him most as a symptom in such patients was the development of dysmenorrhoea in a woman who had hitherto had painless menstruation and in whom very little could be found in the pelvis to account for it in such circumstances the first thing to be thought of was an endometrioma

Dr Gordon Lukep (London) said that his experience had been confined to adenomyomata of the uterus until the previous week, when he had a case involving one ovary in a woman of 30 who had complained of dysmenorrhoea and menorrhagia He had conserved the healthy ovary as he did not recognize the risk of adenomyoma occurring elsewhere

Dr R W Johnstone (Edinburgh) said that he had had relatively a very small experience compared with Dr King having operated only in a few cases of adenomyoma of the uterus as well as in a number of cases of so-called chocolate cysts of the ovary He had doubtless overlooked many cases in which there were tiny pucl ered scars of the pelvic peritoneum which Dr King regarded as of pathological importance He agreed with Professor Watson that the most suggestive symptoms were the onset of dysmenorrhoea in later sexual life combined with menorrhagia dyspareunia, and in many cases sterility He would like to ask Dr King whether he had any idea as to the likelihood of the tiny peritoneal adenomyomata which he had described undergoing spontaneous cure even in the absence of such radical treatment as he was disposed to recommend

Dr King, in his reply, said that he had intentionally kept off the subject of the pathology of these tumours. In spite of the fascination of Sampson's theory, it would not cover all cases. *He thought the typical endometrial* stroma was quite a late development, and with not much stroma there would be very little menstruation

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

A MODIFICATION OF THE PEPTONE TREATMENT IN CERTAIN CASES

For *some time I have* been treating certain resistant cases of asthma, urticaria, etc, with a new peptone *method* which is used after the ordinary peptone method has not succeeded

It is known that in such the blood becomes inspissated by a poison This blood is now removed and immediately poured into a 10 per cent solution of Armour's peptone (No 2), pure and freshly prepared except for the sodium necessary to make it faintly alkaline It is well shaken up, about 3 to 4 parts blood to 1 part peptone, allowed to coagulate, and is put into an *incubator* at 37° C It blood persists with the serum, it is allowed to remain In five to six hours if examined, it will be found that a new substance, anaphylatoxin, has been added to the peptone-serum This entire mass is now carefully removed, and the lot is made sterile with 0 5 per cent phenol It is injected into the vein, beginning with 1/2 c cm and going up to 2 to 3 c cm

THE PHYSIOLOGY OF DEFECATION

Dr Spicer Wilson's memorandum (August 9th, p 237) on the curative action that the sphincter ani may exert on piles raises the question of the proper technique of defecation This process require more time than we are disposed to give it At least two minutes must be allowed for the recovery of the slight prolapse of mucous membrane and the proper closing of the anal door If we do too hurry, the peristaltic downward action of the last inch of rectum will often expel a small residual motion If we hurry this is not only retained but under mucous membrane gives a pain that it resents

If patients are advised to pause to *initiate* deliberately the sudden voluntary closure of the sphincter for a minute or two and to clench with fist and cold water great benefit will accrue It is surprising how clean a cleansing is really necessary if this is done I have cured my own piles on the line, and many patients have done the same

BLOOD GROUPS AMONG SAMOANS

Of recent years attempts have been made to establish racial affinities by means of characteristic blood groupings The following observations unfortunately limited to a small number of persons, are offered as a contribution to this study

The work was done at the Apia Hospital Western Samoa towards the end of 1923 and, after excluding all cases with a known or suspected admixture of European or Chinese blood, there remained 51 cases, presumably pure Samoans, the Samoan being a typical member of the Polynesian race The first step was to separate the various groups for this purpose blood was taken from 17 individuals, and the serum from each blood was agglutinated against the cells from the other bloods also the cells of each blood were agglutinated against the other serum Samoans and Chinese were included in the 17 individuals with the result that all the bloods fell into four well marked groups with one exception, which will be referred to later

Through the courtesy of Dr Colmour pathologist to the Auckland Hospital we obtained type sera belonging to Groups 2 and 3 (Moss) and in this way identified our group We then tested an additional number of cases, giving us a total of 51 Samoans The number of cases in each group and the percentages of the total are given in the following table

Samoans

Group	No of Cases	Incidence
1	4	7 8
2	19	37.3
3	7	13 7
4	21	41 1

This may be compared with Moss's original table as quoted by Rendle Short (*New Physiology in Surgical and General Practice*, p 23)

Group	Incidence
1	5
2	40
3	10
4	45

In addition to these Samoan cases we typed the bloods from 12 Chinese coolies, with the following result

Chinese

Group	No of Cases	Incidence
1	1	8.3
2	1	8.3
3	5	41 6
4	5	41 6

The anomalous case already mentioned was a Samoan. The corpuscles from this specimen or blood were not agglutinated by any of the other (16) serums, the serum from this case failed to agglutinate corpuscles from two cases belonging to Group 2, while it agglutinated the corpuscles of cases belonging to Groups 1 and 3 It did not agglutinate corpuscles of Group 4 It would therefore appear to be an anomalous form of Group 4

Reviews.

AMERICA IN THE WAR.

Hospitals

THE fifth volume of the history of *The Medical Department of the United States Army in the World War*[1] contains an account of hospitalization work in home territories As in some other volumes of the same history to which we have already drawn attention, treatment of the subject is characterized by logical arrangement of the material, a wealth of well documented detail, and an adequate supply of diagrams and other illustrations whenever needed Only about a quarter, however, of the eight hundred pages of text relate to the subject as a whole, the rest being given up to accounts of individual institutions and their doings Consequently much of the volume may be regarded as of domestic rather than of general interest The same is true of the illustrations, those of technical interest, such as detailed ground plans and the like, being relatively few

The hospital problem as it presented itself to the United States authorities was not quite on all-fours with that facing either Great Britain or France Though France in principle delimited a war zone of its own, the greater part of the country was in effect and of necessity a military base for all purposes For hospitalization work Great Britain likewise was a base, since there were frequently times when the hospitals in the British war zone in France, whatever their nominal status, all had in practice to do the work of casualty clearing stations Consequently in Great Britain provision had to be made and to be maintained for sometimes vast numbers of men arriving almost straight from the field of battle But apart from this it was a general principle in France, though not always observed, to evacuate to England at a relatively early date all cases likely to require prolonged treatment, unless they belonged to certain limited categories In view of the huge casualties liable to occur in conditions of modern warfare, this procedure was inevitable since the British war zone in France was nowhere of any great depth, barely fifty miles of country stood between most of its coastal towns and the enemy trenches, and there was thus a very distinct limit to the possibility of arranging suitable sites for the innumerable stores, camps of all kinds, and hospitals required The number of hospital beds habitually maintained was always greater than was pleasing to the High Command on account of the increased strain thrown on the transport and supply services, and it must have been a source of anxiety to the D G M S himself at critical moments brought about by enemy successes

The United States Army, on the other hand, with its disembarkation ports on the Atlantic coast, could spread itself pretty much as it pleased over Western and South-Western France, *and it was early decided to adopt the* principle of not sending home any case likely to require less than six months' treatment In short, for the United States soldier relatively few wounds spelt "Blighty" in the true sense of that word, although as a matter of fact, as shown in the first volume of our own *Medical History of the War*, some 13,000 sick and wounded from the American forces were taken to England between March and December of 1918

Consequently in the United States itself the chief demand for accommodation would seem to have been in respect of cases of sickness and injury arising at the pre-war military posts and in new training camps, of which thirty-two were in use or in process of formation at the date of the armistice, also for similar cases among troops under orders for France and awaiting shipment at embarkation ports But general hospitals were also provided for the treatment of special cases of all kinds and for the final treatment of any patients sent back from France For the temporary reception of the latter prior to redistribution sundry debarkation hospitals were established in the neighbourhood of New York, for the treatment of cases of tuberculosis arrangements were made in suitable areas

A further *outcome of the relative limitation* of the problem was that it does not seem to have been found necessary to provide more than about 120 000 beds, or, in other words, about one-third of the number habitually maintained in the United Kingdom, that of these 120,000 beds fewer than two-thirds were actually occupied at the date of the armistice Nevertheless, with a view to future possibilities, plans were being made at that date for 60,000 more beds

On the declaration of war the Medical Department received numerous offers of buildings for use as hospitals, it accepted many and transformed them as circumstances required, but the greater number of hospitals were specially built As a rule they seem to have been single story buildings, but the size of the ward units and their distribution differed considerably Wards containing from 50 to 100 beds were considered most convenient for administrative purposes, and no objection to them on other grounds seems to have been experienced In view of their special purpose it was anticipated from the beginning that the provision for sitting-up cases would have to be large, and in the event it was found that the proportion of men able to take their meals at the common table, and requiring more or less active exercise, was often 75 per cent, and even as high as 95 per cent, among cases sent back from France A large number of the hospitals seem to have gone in for teaching their patients various trades, and some were definitely charged with reconstruction work

Whenever possible every hospital was placed for administrative purposes under the command of an officer belonging to the Medical Service of the standing United States Army His staff was formed of ordinary medical officers specially selected and trained for the purpose On the professional side the work was divided into three services—*medical*, surgical, and laboratory—each working under a chief The standard permanent staff for a 1,000-bed hospital was one colonel or lieutenant-colonel, four majors, twelve captains, and thirteen lieutenants, of the Medical Corps, two officers of the Sanitary Corps, two of the Dental Corps, one captain of the Quartermasters' Corps, one trained nurse for every ten patients, and two enlisted men for every five beds In addition most of the hospitals had supplied to them a "dietetic specialist"—that is, a woman specially trained in sick-room cookery—and the chiefs of laboratories could increase their staffs by employing civilian assistants

Perhaps one of the most striking features of the whole account is the great importance that was attached to administrative work in hospitals, and the number of medical officers set aside for this purpose Another is the elaborate character of the arrangements made for the instruction of medical officers in military medicine and surgery, and for *the bringing up* to standard those whose general medical knowledge was deemed to be subnormal

Incidentally the volume reveals that it was the intention of the United States Government to land in France by the middle of the year 1919 a total of 3,360,000 men, and to maintain in the home territory a reserve of a further 1,400,000 The volume, like the others to which we have drawn attention, is supplied with an exhaustive index, and gives, too, a sketch of the evolution of military hospitals in general Credit for the first conception of the pavilion type of hospital is given to Stonehouse (Plymouth), where a naval hospital on this plan was built about the year 1754

DIAGNOSIS AND TREATMENT OF NEPHRITIS

THE first edition of Professor HUGH MACLEAN'S *Modern Methods in the Diagnosis and Treatment of Renal Disease* has, as anticipated in our review (1922, i, p 146), met a distinct want, for there have been two fresh impressions, and a second edition,[2] somewhat enlarged and with some

[1] *The Medical Department of the United States Army in the World War* Volume V Military Hospitals in the United States Prepared under the direction of Major General M W Ireland by Lieut Colonel Frank W Weed Washington Government Printing Office 1923 (Sup roy 8vo, pp 857 201 figure 2.50 dollars)

[2] *Modern Methods in the Diagnosis and Treatment of Renal Disease* By Hugh Maclean M D D Sc Second edition revised and enlarged London Constable and Co Ltd 1924 (Demy 8vo pp xii + 417 4 plate 4 figures 2 charts 124 net)

additions, has now appeared On the basis of functional disturbance as determined by chemical tests chronic nephritis is divided into two forms—the azotaemic, characterized by retention of nitrogenous products and corresponding to chronic interstitial nephritis and the hydraemic form with retention of sodium chloride and oedema, the much less frequent parenchymatous nephritis The chapter on this subject is enlarged by the addition of four successful coloured plates illustrating the histological changes, which have been provided by Dr S C Dyke, pathologist to the Clinical Units at St Thomas's Hospital These plates show the complete absence of inflammation in hydraemic nephritis, and that when as generally happens, the hydraemic form progresses into the azotaemic there is always in addition to considerable degeneration of the renal cells more or less well marked inflammation, as shown by definite proliferation of the interstitial fibrous tissue of the kidney Occasionally the degenerative change responsible for the hydraemic form undergoes cure and the further lesion does not supervene It is suggested that the toxin causing pure degeneration of the renal cells is not the same as that responsible for this degeneration when associated with interstitial inflammation on this point, however further information is necessary The plate showing the micro copic appearances of a primary chronic interstitial (azotaemic) nephritis is much the same as that in progressive hydraemic nephritis

Another addition in this edition is in the section dealing with the high concentration of urea in the blood There is a want of correspondence between the apparent clinical condition of patients with progressive hydraemic nephritis and the amount of blood urea for the oedema may disappear and they may cease to vomit and yet have a steadily rising blood urea—a danger signal with a hopeless prognosis These cases are comparable to those of subacute bacterial endocarditis with apyrexial periods where recovery appears probable though a fatal termination always ensues The discussion of high blood urea with healthy kidneys brings out possible pitfalls and fallacies, such as the danger of concluding that the combination of high blood urea and albuminuria justifies a diagnosis of uraemia, for this may be due to an abdominal abscess or empyema, when the percentage of urea in the urine will be fairly high—from 2 5 to 3 5 per cent or even more In doubtful cases, therefore, the percentage of urea in the urine should also be estimated, for in the presence of 2 per cent of urea in the urine the existence of uraemia can be safely excluded

In conclusion, this condensed but clear account of the modern conception of renal disease should be in the hands of every general practitioner who has not recently revised his knowledge of the subject, so as to enable him to deal in a competent and up to-date manner with his patients

ANAESTHESIA LOCAL AND GENERAL

In the preface to his book *The Science and Art of Anaesthesia*[1] Colonel WEBSTER, M D, who is professor of anaesthesiology in the University of Manitoba Medical School, states that he has written it in order to place before the medical student and general practitioner a small manual, concise in form, but not so brief as to leave matters imperfectly explained

A short chapter on the history of anaesthesia is followed by a discussion of the physiology of the subject, which is well written, and though condensed should suffice for the average needs of the student Each anaesthetic is then considered in turn, and there follows a chapter on local and spinal anaesthesia Anaesthetic mixtures and sequences are next discussed, after which follow chapters on the selection of the anaesthetic, the nature of the operation, the heating of the gases, preliminary medication, and pre-operative and post-operative treatment The effect of temperature and moisture on post-operative conditions is then described and separate chapters are devoted to surgical shock, post anaesthetic acidosis the patient's viewpoint, the art of anaesthesia, statistics, anaesthesia records, and the medico-legal aspect of anaesthesia The English student may find that the apparatus described is not all of a pattern with which he is familiar, but the illustrations, which are not too numerous, are quite satisfactory, and there is a commendable absence of misprints

The second edition of the American translation of Professor Braun's book bears the title *Local Anesthesia Its Scientific Basis and Practical Use*[2] It is ten years since the first edition appeared, and in the meantime much has been written on the subject as the result of the great war This second edition retains all the merits of the first There are sixteen chapters the first ten are devoted to general considerations, the last six to descriptions of the operations on the various parts of the body The first chapter is on the history of local anaesthesia up to the discovery of cocaine, and is followed by others on sensation and pain, anaesthesia and anaesthetic methods, on the pain relieving action of nerve compression and anaemia, on anaesthesia by means of cold, on the influence of the osmotic tension of watery solutions injected for purposes of local anaesthesia, on absorption, and so on Local anaesthetic agents are then described, and the physiological and toxic properties of each fully discussed Then follows a chapter on further aids to local anaesthesia, including such manœuvres as ligation of limb, the chilling of tissues, and the action of adrenaline Methods of using the drugs are next described, and the value, indications for, and general technique or local anaesthesia discussed, the instruments used, the solutions recommended, and the general technique of infiltration and conduction anaesthesia are fully explained The illustrations of which there is a sufficient number, are clear and well chosen One point Professor Braun insists upon—the unsuitability of the modern operating table for the practice of local anaesthesia—should be emphasized The modern table, while very convenient for the surgeon, is most uncomfortable for a conscious patient A mattress covered with sterilized rubber sheeting should always be provided for a patient who is to undergo a long operation under local anaesthesia

The book is a very fair presentation of the relative merits of local and general anaesthesia, for the author does not let enthusiasm for his subject outrun discretion

ELECTROTHERAPEUTICS AND DIATHERMY

THE first nine chapters of *Practical Electrotherapeutics and Diathermy*,[3] by Dr MASSEY, deal with the various currents used in medical electricity, and occupy rather less than a third of the book The nature of these currents, the machines which produce them, the methods of applying them, and their actions on the body, are described The remainder of the book deals with the electrical treatment of disease

In Chapter X, which is entitled "Electricity in General Surgery," are described electrical methods of treating aneurysm, cystic goitre, tuberculous glands, etc, and an account is given of a method of performing tracheotomy with a cautery knife Chapter XI is entitled "Electricity in Industrial and Reconstructive Surgery" but, apart from a short section on the removal of lead and mercury from the tissues deals entirely with electro-diagnosis and the testing of the reactions of muscle and nerve "Electricity in Oncology" is the title of Chapter XII the longest in the book (92 pages) In the remaining chapters (XIII to XIX) the electrical treatment of diseases of various regions and systems of the body is described

The chapter which will arouse most interest among English readers is that on the treatment of malignant growths by zinc ions The author has made a special study of this method for many years, and his results,

[1] *The Science and Art of Anaesthesia* By Colonel William Webster D S O M D C M London Henry Kimpton 1924 (Med 8vo pp 214 2s net)

[2] *Local Anesthesia Its Scientific Basis and Practical Use* By Professor Dr Heinrich Braun Translated and edited by Major Im L Harris M D Second American from the sixth revised German edition London Henry Kimpton 1924 (Roy 8vo pp x—411 231 figures £2 net)

[3] *Practical Electrotherapeutics and Diathermy* By G Betton Massey M D London J and A Church ill 1924 (Med 8vo pp xvi—617 157 figures 21s net)

judging by the illustrations and descriptions, seem to be excellent. The patients have been kept under observation for not less than two years. His method is described in full detail. Usually multipolar electrodes are used, and constant unidirectional currents of 2,000 or even 3,000 milliamperes are concentrated in and around the growth. With currents of this intensity heat is also developed, and a temperature sufficient to coagulate the proteins is reached. The method is therefore one of diathermic coagulation combined with chemical cauterization. It might be thought that risk would attend the use of currents of this kind and strength, even though the electrodes are confined to the site of the growth, but no misadventure is reported.

The author's observations on the treatment of tuberculous glands and cystic goitre by germicidal and cauterizing ions will be read with interest. He has devised special methods which, in his hands, seem to have produced good results.

In the account of the testing of electrical reactions attention is paid chiefly to the original method, in which the faradic and galvanic currents are used. The account of the condenser method and the description of the recommended by Lapicque are taken from the writings of other authors. A wrong impression is given of the meaning of the term "chronaxie." The definitions given on page 41 confuse ionization with cataphoresis. Such expressions as "the soapy ions of sodium and hydrogen," "the cations of water" (p. 41), and the statement that 2 per cent is usually the strength at which the molecules of a substance are most fully ionized by water" are unscientific and inaccurate. There are certain other mistakes and inaccurate expressions in different parts of the book. Thus we read on page 133 that "ozone and nitrous oxide will appear in great abundance at the surface of the positive pole, while the negative polar surface will receive a similar blast of nitrogen".

The book is more suitable for the advanced reader than the beginner. Those who are experienced in electrotherapeutics will find much that will interest them, especially in the chapter on the destruction of new growths.

AN ATLAS OF ANATOMY

THE *Hand-Atlas of Human Anatomy*,[1] by Professor SPALTEHOLZ, has entered its seventh German and its fourth English editions, and may, we think, be said to be without any serious competitor in its own particular field. The illustrations have now reached the formidable total of 994—a considerable advance on the number in the previous English edition, the increase is largely attributable to the addition of figures illustrating the development of bones, made from specimens prepared by a method of Professor Spalteholz's own invention. With this large number of figures it has been possible to ensure that every part of the body is adequately illustrated in various stages of dissection and from almost every conceivable point of view. The dissections have been made with great skill and ingenuity, the standard of reproduction is consistently high, whether judged from the point of view of accuracy, clearness, or artistic merit, the artists are particularly successful in their manipulation of light and shade, an important feature in anatomical drawings. While most of these drawings are faithful representations of dissections, with sufficient discriminative arrangement and selection to emphasize the relationships which it is desired to show, the author does not hesitate at times to introduce figures of a diagrammatic type, certain of these, in connexion with the anatomy of the central nervous system, are particularly successful and commendable. At times, too, figures are included of parts as seen with low magnification. Perhaps some idea of the completeness of the work may be obtained from noting that no fewer than forty figures are assigned to the origin of sight and forty-three to that of hearing. At the foot of each figure is a compendious legend, so that in a sense the Atlas partakes of the nature of a textbook. The work is singularly accurate, although very occasionally minor faults can be detected in labelling or in colour registering. The Atlas is so complete and perfect as to present a very strong temptation to the student to substitute it for his own dissections, but perhaps the price of the book and the influence of his teachers will constitute adequate safeguards. It is as a work of reference that it will be of most assistance and utility.

[1] *Hand-Atlas of Human Anatomy*. By Werner Spalteholz. Professor of Anatomy in the University of Leipzig. Edited and translated from the seventh German edition by Lewellys F. Barker, Professor Emeritus of Medicine, Johns Hopkins University. Fourth English edition. Three volumes. Philadelphia and London: J. B. Lippincott Company. 19-3. (Sup. roy. 8vo, pp. 602, illustrated. 70s. net the set of three volumes.)

WHITE MEN IN THE TROPICS

THOUGH the interest of the home country in the effect of white races of residence in hot countries may have been diminished by recent political tendencies, the question involved is of great and even growing importance for certain of the dominions, and in particular for Australia in respect of Queensland. We therefore draw attention to an extremely pessimistic essay published in a small volume by a French author, whose sex and status are not indicated on the title-page. Sundry passages in the text, however, justify the conclusion that it is from the pen of a medical man of long experience in the colonial service of the French Government. His statements relate solely to the assumed effects of long exposure to heat, those of the diseases more or less endemic in tropical zones are excluded from consideration.

He does not believe that there is ever any true acclimatization of white folk, and he does believe that long before the attainment of any condition that could reasonably be given that name most individuals would have seriously degenerated both physically and psychically. Among the physical degenerations are marked prominence of the abdomen, atrophy of voluntary muscles, displacement of various abdominal organs, baldness, or premature whiteness of the hair, and a relatively early onset of old age. The phenomena, he says, are so common and so often combined that when accompanied by a bronzed skin the individual, often coupled with arterial sclerosis. The first three he declines, looks like a frog, and wherever met can at once be recognized as a "colonial," by which term the French seem always to mean a Government or commercial employee in a hot country. The individual looks like a frog because a sunk chest and a large stomach are supported on a thin pair of legs and balanced by attenuated arms, by the precise tone of the face colour, in spite can even tell from what particular marsh this human batrachian hails. Seemingly those who attain this appearance are rather to be congratulated than otherwise, since only the sickly remain thin. It is asserted, too, that individuals who after having become nominally acclimatized return to live at home generally get killed off by influenza or some congener in a very short time. Doubtless this is a subject of regret to their friends, but if our author's statements are to be taken at their face value it must from the general standpoint be considered rather a good thing. For if the physical results of long subjection to heat are unmixing, the psychical results would seem to be still more unhappy. The length of service of a white resident in the tropics can, our author says, be told by the degree of his conceit and self-assurance, of his scorn of medical knowledge, and of other kinds of culture which he does not possess, and of his readiness to rush into print. If some piece of work of his, such as the building of a bridge, fails it is never his fault but somebody else's, and as he grows older he tends to become extremely pompous and to use none but sententious language. At all stages he is ready to quarrel about nothing, to indulge in alcoholic drinks to try all sorts of evil narcotics to get so physically lax as to be unwilling to walk even a few yards, to lose all moral sense, and, especially if his work lies among the bush native, to become a veritable satrap, meanwhile he is lucky if he

Les Blancs en Pays chauds: their acclimatization and degeneration. By Dr. Jaubert-Aubery. Paris: J. Malvoine et Fils. 1924. (Cr. 8vo, pp. 160. 6 fr.)

does not develop a phobia of some kind or lose all will power A further effect of the sun is said to be heightening of the imagination which leads the victim, if engaged in conversation to swamp his companions by his volubility and tireless disregard for truth The effect on white women residents is of a corresponding kind, and when not engaged in dress competitions they endeavour, morally speaking to wear their husbands' trousers

Most of us are acquainted with many individual who after spending most of their lives in hot countries remain of good physique and couple with a broad experience of life a mentality fully equal to that of such of their cousins as have remained at home The statements of our author will therefore be received with distrust both in France and in this country Hence it should be added that he concludes his volume with a number of much more acceptable statements Summed up, they are to the effect that both the French Government and French commercial houses should reject for employment in hot countries home failures, and should choose none but men of the very highest types they can get The age limit should be *not* less than 25 on first appointment and at the age of 50 they should be retired Meanwhile they should be sent on long leave at the lapse of every two years, and all forms of physical activity among them should be encouraged Subordinate posts should be filled solely by natives and the recent tendency in France to regard its tropical possessions as suitable places for ordinary domestic life including the raising of families should be discouraged The author also holds that the English practice of living isolated from native society is sound, and that the French readiness to welcome in France men of colour of all kinds, and to treat them as equals is to be regretted There can be no true acclimatization he holds, either of white folk in tropical zones or of coloured races in Europe in countries and sooner or later, if current tendencies continue the French race, as a race may suffer accordingly

THE UNADJUSTED GIRL

THE fourth Criminal Science Monograph published as a supplement to the *Journal* of the American Institute of Criminal Law and Criminology is entitled *The Unadjusted Girl*[1] and is edited by WILLIAM I THOMAS with a foreword by Mrs W F Dummer A quotation from the preface will show the motive inspiring this book

Modern psychology is throwing so much light upon human behaviour that, concerning delinquency one cannot do better than follow the teaching of Spinoza 'Neither condemn nor ridicule, but try to understand'" Such an attitude led to the widespread sociological study of delinquency, and later to the establishment of the first mental clinic in connexion with a court A great number of case histories are reported at length in the book, and from these psychological arguments are deduced The editor remarks, however, that—

> Statistics in themselves are nothing more than the symptoms of unknown causal processes A social institution can be understood and modified only if we do not limit ourselves to the study of its formal organization but analyse the way in which it appears in the personal experience of various members of the group and follow the influence it has on their lives

Mrs Dummer quotes from James Hinton the English surgeon, who said just after the American civil war "Prostitution will pass as has slavery when it becomes too great a burden for humanity to carry" Prostitution and promiscuity she considers, will be eliminated not by force, but through sublimation

The editor interprets to-day's unrest as a period of individualization following and preceding periods of socialization, and emphasizes the present opportunity to reorganize the administration of justice

The titles of the chapters sufficiently indicate the scope of the book — 'The Wishes' "The Regulation of the Wishes" "The Individualization of Behaviour" "The Demoralization of Girl," "Social Agencies," and 'The Measurement of Social Influence" Each chapter is amplified by full notes from many cases

NOTES ON BOOKS

THE issue of the fifth edition of the useful handbook *Anaesthetics in Dental Surgery*[1] follows close on the death of its originator Dr J D LUFF The editor of the new edition, Mr J Stuart Poss, pays a tribute to him in the opening lines of his preface Though the book has been entirely rewritten and has materially gained thereby, the impress of its first author remains In particular the chapters on gas and oxygen and on local anaesthesia (rewritten by Major W T Finlayson) have been greatly improved The replacement of an index by a synopsis and cross references we do not consider an improvement even in a small book As an example, the only reference to acide is we can find is in the very interesting chapter on ethyl chloride, and it is noted in connexion with children only the conduit on is of importance in all cases of general anaesthesia and at all ages, and an index would quickly have revealed the author's position In the chapter on chloroform the author fights well the battle of "safety first," and, while admitting that there are cases where chloroform *must* be given for dental extraction, strongly advises against its general use We note in the chapter on nitrous oxide and oxygen the statement that analgesia is a stage reached before the loss of consciousness, and that even live pulps can be extirpated painlessly, during this stage We venture to ask the author whether here be any such stage during 'gas (or "gas" and oxygen) administration Our experience is that pain is more acutely felt at the moment of losing or regaining consciousness There are a few lapses from English pure and undefiled as at the bottom of page 136 and in the tautology of the second paragraph of page 189 which are worth a caution in a book so pleasantly written Both for its contents and its diction we recommend it to those for whom it is specially intended —the dentist and those medical practitioners who would understand *what the dentist requires of the anaesthetist*

Dr HEWLETT'S work on infection and resistance, of which the third edition has recently been published[2] is, as its subtitle states, an exposition of the biological phenomena underlying the occurrence of infection and the recovery of the animal body from infectious diseases with a consideration of the principles underlying specific disease and therapeutic measures The opening chapters deal with the problem of virulence, the varieties of bacterial poisons, and the question of immunity, and are followed by a discussion of toxin and antitoxin, the bactericidal properties of blood serum cytolysis and sensitization, and the complement and its practical applications The phenomena of agglutination, precipitation, phagocytosis, and chemotaxis, are described, and several chapters are given to anaphylaxis, serum sickness and the allied subjects of food and drug idiosyncrasy and hay fever The concluding chapters deal with active and passive immunization and protein therapy

We have received the first two publications[3] of the Ravetllat Pla Institute of Barcelona in which a new conception of the bacteriology and pathogenesis of tuberculosis is set forth The first publication is a lecture delivered in June, 1922 by Dr I PLA Y ARMENGOL, and the second is the conjoint work of the late veterinary surgeon J RAVETLLAT and Dr PLA Y ARMENGOL The writers maintain that the organism of tuberculosis may appear in three different forms, each of which may be transformed into the other—namely, a diplococcus or diplo-streptococcus, which they call the attacking bacterium an intermediate or transitional form, and Koch's bacillus The attacking bacterium, which is always found in the active lesions and the internal organs, especially the spleen, possesses great vitality Under unfavourable conditions it loses part of its vitality and becomes converted into the intermediate bacterium in the form of granules which represents the first phase of resistance and is chiefly found in the pus Under still more unfavourable conditions the organism assumes the form of Koch's bacillus, which represents the phase of maximum resistance and is most frequently found in the tubercles

Nova et Vetera.

DR JOHN BASTWICK

Munk's *Roll of the London College of Physicians* is perhaps more often used as a source of instruction than amusement, although it contains many good stories Munk's virtues are not very attractive to most people, and his failings are, we suspect, repellent to the youth of this generation Munk loved a scholar and a gentleman of the old school, he thought it was a point in a physician's favour to be able to write good Latin, and he had very little sympathy with rough, quarrelsome folk who did not behave like gentlemen and scholars With a subject like Sir George Baker, Munk was at his best, but he was a little unhappy about and puzzled by Sydenham's neglect to become in F R C P , and he could see no redeeming features in the career of Dr John Bastwick

Bastwick was indeed no gentleman—in the Munkian sense To begin with, although he was entered at Cambridge, he never took a degree there Then, "apparently not satisfied with his progress in the profession," says our annalist, "and being a man of strong zeal and warm imagination, he applied himself to writing, more particularly against Popery" This rude behaviour led to a fine of £1,000, excommunication, prison and removal from the list of Licentiates Even this did not crush the rebel "His violent temper," says Munk, "would not permit him to be quiet" He became even ruder than before, and in 1637, after arraignment in the Star Chamber, when, is Munk says he expressed himself in 'extraordinary terms,' he lost his ears and was packed off first to Launceston and then to the Scilly Isles to await the time when the proceedings against him were reviewed in the House of Commons—possibly in extraordinary terms—and in the college

D Presidens et Censores judicabant D Bastwick in locum quem habuit in Collegio et ad libertatem praxios restituendum, et omori superiorum censura pro restituto habendum, et accipiendum apud omnes Socios Candidatos et Licentiatos

This was in 1640 He was to have had money compensation from the estates of the Archbishop of Canterbury but it does not appear that he ever received it, his affairs were still under discussion in Parliament in 1648

What became of him after that is not known It is generally thought that he returned to Colchester He died apparently in London Smith records his burial on the 6th October, 1654

Such was the career of Bastwick according to Munk The facts are no doubt correct, but there seems something wanting in the interpretation It seems incredible that a man, however violent his temper would think that attacks on the best people would be a professional recommendation in 1633 Bastwick was a college physician, not in empire So it is easier to believe that violent temper rather than fewness of patients was the motive, and charitable to think that some courage went with the violence of temper

An examination of the proceedings against Bastwick, Burton, and Prynne for several libels, in the *State Trials*, bears out this view Bastwick was certainly "no gentleman," but some of the extraordinary terms" not quoted by Munk suggest that in addition to a violent temper he had both courage and wit For instance we find this dialogue

Lord Keeper 'What say you Mr Doctor are you guilty or not guilty?' Answer Yea or no you needed not to have troubled yourself so much about so large an Answer

Dr Bastwick 'I know none of your Honours have read my Book and can you with the Justice of the Court condemn me before you know what is written in my Books?'

This was a ficer, because the court had certainly not read them (they seem to have been rather long), so the doctor was asked about an extract which had been read in court, and replied

My Lord he that read it did so murder the sense of it that had I not known, what I had written, I could not tell what to have made of it,

After a few more exchanges, Lord Arundel moved the court to take the case *pro confesso*, which was allowed, whereupon Bastwick said

"My noble Lord of Arundel, I know you are a noble prince in Israel and a great Peer of this Realm, there are some honourable Lords in this Court that have been forced out as Combatants in a single Duel, it is between the Prelates and us at this time as between two that have appointed the Field The one being a Coward goes to the Magistrate and by Virtue of his Authority disarms the other of his Weapons and gives him a Bullrush, and then challenges him to fight It this be not base Cowardice, I know not what belongs to a Soldier This is the Case between the Prelates and us, they take away our Weapons (our Answers) by virtue of your Authority, by which we should defend ourselves and yet they bid us fight My Lord, doth not this savour of a base cowardly Spirit? I know, my Lord, there is a Decree gone forth, (for my Sentence was passed long since) to cut off our Ears," (for my Sentence was passed long since) to cut off our

The Lord Keeper was much shocked by this insinuation and asked, "Do you prophesy of yourselves?" It was at least an accurate prognosis Dr Bastwick's speech before torture is not so fully reported as that of his more famous fellow sufferer Prynne, and is, for the most part, in common form, but there is a touch of rough humour in his addition to a criticism by Prynne of the writings of one Heylin

"There is another book of his licensed,' said the doctor, "wherein he rails against us three at his pleasure, and against the Martyrs that suffered in Queen Mary's days, calling them Schismatical Heretics and there is another book of Pocklington's licensed they be as full of Lyes as Dogs be full of Fleas, but were the Presses as open to us as they are to them, we would pay them, and then great Master that upholds them, and charges them with notorious Blasphemy"

The piety of Bastwick won in the end, and the foreshortening of historical perspective leads us to underestimate the courage needed to be on the winning side before it was the winning side King and Archbishop lost their heads—and it is worse to lose one's head than one's ears. But it is not pleasant to lose one's ears, and the violent-tempered doctor deserved a kindlier epitaph than he received from Munk

PUBLIC EDUCATION IN HEALTH

Sir George Newman's Memorandum

Public education in health is the subject of a memorandum by Sir George Newman addressed to the Minister of Health and published by H M Stationery Office at the price of sixpence It is a pamphlet of only thirty-five pages, but in that brief space its author succeeds in presenting a remarkably comprehensive survey of the whole subject with which he deals

In a prefatory note Sir George Newman holds that the time has come when, notwithstanding the scope and character of the voluntary health movement in this country, the responsibility of central and local authorities for education of the public in respect of health should be more fully appreciated, "particularly in view of the fact that our national health organization has not kept pace with our advance in the science and art of preventive medicine" In the first section of the memorandum he insists that this advance in knowledge can do nothing of itself to safeguard health 'unless it be *understood*, *accepted*, *and practised*," and he quotes the late Professor Sir Henry Jones of Glasgow as declaring that—

> the best State is that which both does most for the individual and enables him to do most for himself I do not doubt for a moment who our ruler is about to be in State and city *It is public opinion* the State is not safe unless public opinion is enlightened opinion and the task of converting public opinion into educated opinion is so vast as to require the best powers of us all

It is in that spirit and from that point of view that the Minister of Health's chief medical officer addresses him

Going on to deal with the personal aspect of preventive medicine, he illustrates his views of the importance of individual appreciation of health in relation to sanitation, disease of the respiratory tract, digestive disturbance, dental decay, infectious diseases, maternal mortality,

infant mortality, rickets, cancer, and nervous and mental troubles, and he urges the importance of periodical physical examination—a subject which, it may be mentioned in passing, was pressed on the attention of the Royal Commission on the Poor Law, but without any success

Central Authorities' Work

Turning next to the educational work of the Ministry of Health and Board of Education, he remarks that the former body acts mainly indirectly, through the local authorities, and by inspections, interviews, correspondence, annual reports, special reports, circulars, and other documents Also it subsidizes local authorities in portions of their services which may include educational and propagandist work It furnishes public health news in answers to questions in Parliament, in communications to the press, and in replies to inquiries The Board of Education has direct educative duties, instruction in hygiene and physical training being within the school curriculum The Board has issued also a series of syllabuses on the subject of health, and for these there has been a good demand 'There is no subject in the school curriculum which has a more romantic story behind it than the triumphs of the progress of hygiene during recent years Such instruction should be given in the simplest language and should be woven into the geography and history of the world or associated with the great discoverers of modern times—Harvey, Jenner, Simpson, Pasteur, Koch, Lister, Manson" Besides medical inspection and treatment of school children, the Board has encouraged schools for mothers, which have been remarkably successful

Local Authorities' Work

Leaving the central authorities, the educational work of local authorities is next commented on Reference is made to regulations relating to tuberculosis, venereal disease, maternity and child welfare, and the Rats and Mice (Destruction) Act It is urged that the law should be made clear as to the powers of local authorities to spend money on health propaganda Insurance committees are clearly endowed with such a duty and responsibility, and some have performed it, but of far more importance than any statutory sanction "is the educational work naturally and properly performed by the insurance practitioner in the ordinary discharge of his duty to the patient" Much excellent teaching has been done by medical officers of health in their annual reports, whilst some county and borough councils (London, Marylebone, Blackburn, and others) have been very helpful in various directions—the issue of pamphlets and leaflets, the promoting of baby weeks, health weeks, rat weeks, the delivery of lectures, the holding of exhibitions, and by education through local journals

Voluntary Work

Leaving central and local authorities, the educational work of voluntary bodies is next dealt with These are in many ways able to permeate the minds of the people with new knowledge of practical value, to lead public opinion in support of government and the best ways of progress, and to inform official bodies of their experiences among the people Voluntary societies are now surprisingly numerous The memorandum gives a list of twenty-three, and briefly indicates their special objects The first was the British Red Cross Society, founded in 1870 and the most recent mentioned is the Central Council for Infant and Child Welfare of 1919 Sir George Newman is of opinion that—

> we are gradually coming to that stage of enlightenment at which public opinion is able to sort out the good from the bad to discriminate between those measures that are for the public well being and protection and those that are merely to serve passing political advocacy particular classes of society or the ends of vested interests Hence the co-ordination between the various voluntary health organizations on the one hand and the authorities responsible for local and central government on the other is of increasing importance and necessity

"Public health education in other countries" is the title of the next section of the memorandum The United States takes first place here The Federal Public Health Service provides a scientific basis in periodic and special reports, lectures articles, cinema films, and broadcasted messages The department distributes information, but does not conduct propaganda In most of the individual States and larger cities there is a propaganda division in the Department of Health providing press articles, lectures, pamphlets, and leaflets The methods pursued in Pennsylvania include a quarterly *Journal of Public Health*, a fly campaign every springtime a campaign for periodic medical examination of individuals, health lessons, information to newspapers, weekly health talks" by a large number of prominent physicians, motion pictures, lantern slides, etc, and comprehensive distribution of literature, charts exhibition materials, leaflets, and so forth Other States act similarly, and a great life insurance company has trained its agents in popular health instruction as well as employing visiting nurses, issuing literature, and arranging for lectures Canada acts on the same lines, also New Zealand, and the subject is being considered in South Africa and Australia Much educational work is being done in France, Germany, Serbia, and Jugo-Slavia, but much less in Soviet Russia, where very little money is available for public health activities," though the authorities are concentrating on propaganda

Observations and Conclusions

The final part of the memorandum is entitled "Some general observations and conclusions" As regards the present position in England and Wales, it is pointed out that the policies and administration of different countries are not comparable, and there should be no slavish imitation The local authorities and their officers and the voluntary societies do much educational work, though instruction relevant in one area may be superfluous in another The work of the local authorities is likely to be better in kind and degree and more timely, while that of the voluntary societies may be more stimulative and even critical, and may possess a missionary zeal and public spirit lacking in the routine of the health authority Now that the comprehensive sanitary system and relatively advanced health service are generally accepted and settled there is need for discrimination and differentiation of function Some voluntary work has tended to be sporadic, perfunctory, and inexpert Overlapping has not been without advantage, but technique leaves something to be desired, and leaflets, posters, etc, have not always been attractive or persuasive, though the pamphlets of the League of Red Cross Societies are admirable There are two objects first, to arouse enthusiasm and awaken a health conscience, in other words to stimulate, and secondly, to disseminate knowledge—to instruct The teaching should suit the requirements of the taught, and careful attention should be given to the distinction between the objects—to interest, to instruct, and to secure that the instruction be acted on

The forms of public education in health require full and careful consideration—lectures, leaflets films baby weeks, food exhibitions may or may not be suitable or timely and may or may not harmonize with local collateral services or facilities Misplaced propagandism may be very harmful, and much may be lost by unwitting misrepresentation of facts and remedies both as to value and practicability There are two chief forms of public education in health "(1) the regular process of education inherent in the effective discharge of the public health services, (2) exceptional advocacy, propagandism or supplementary teaching by other means" Sir George Newman holds that the former of these is the better, and illustrates this by depicting a population of 100 000 with its 16,000 children or school age its 35,000 insured, its 2,000 expectant mothers yearly its 1,000 tuberculosis cases all duly looked after He says that there are, however, three reasons why the State organization needs supplementing by other methods These are very briefly, that the statutory system cannot exercise control or personal health and habit that it requires impulse from the people as a whole to make it effective and that the people "require instruction in understanding, using and putting into operation the public provision made on their behalf" The methods for providing supplementary teaching by local authorities or voluntary societies are manifold and varied, and the choice must depend on circumstances, conditions, persons, means, and resources

The conclusions with which the memorandum finishes are such that they cannot satisfactorily be condensed and are therefore quoted in full.

CONCLUSIONS

In summary, it must be said that there is *great and exceptional* need for public education in health First, there has been a growth of knowledge in the science and art of medicine and its application to many morbid conditions now known to be preventable, secondly, there has been a rapid development of the whole system of sanitary governance and public medical services—*and public opinion has not kept pace with the e two profound changes* Yet without an enlightened public opinion the measure and value of scientific and legislative advance is impaired It is true that attempts have been made—all of them public spirited, many of them gallant, and a few of them even heroic—by the voluntary service of persons or societies to meet this situation and fill the breach On the whole these efforts have met with encouraging, and sometimes enduring, success But such enterprise is in need of guidance and support, and is liable to some degree of misdirection It lacks unity, tends to become chaotic, is without adequate supervision, and is, all too often, insufficiently related to the new knowledge and the expanding organization

My submission is that the educational functions of local authorities and voluntary societies require, at the present juncture, fuller and more careful consideration and more effectual organization

(*a*) All local authorities are indirectly engaged in educational work inseparable from the effective discharge of their statutory duties under the Public Health Acts, and this aspect of their services is paramount It is on the whole the most important and universal form of public education in health

(*b*) Some local authorities, in addition, are undertaking supplementary educational work of a more direct nature, though others are, or deem themselves to be, debarred or at least restricted in this more direct sphere of education It seems to me desirable that any ambiguity on this point, or in the law itself, should be removed as soon as possible, so that upon all local authorities there should be *imposed a power or a* duty of direct educational work

(*c*) Then I think the time will have come for the Government to consider whether such educational work is of sufficient importance and value to be assisted financially by in Exchequer grant under the Ministry of Health, which would naturally take the form of a provision available to local authorities for certain approved types of educational work in hygiene

(*d*) Lastly, these two steps in re defining the powers under which educational work is undertaken by a local authority, and encouraging its development, will inevitably raise the question of the extent to which and the terms on which, voluntary societies should also officially participate in the more direct form or such instruction (as distinct from the indirect educational work inherent in an efficient sanitary service) On this subject it would not be appropriate for me here to say more than that in my opinion it is the local authorities who must be directly responsible for undertaking educational health work direct as well as indirect, suitable to their own district, circumstances and needs with such supplementary special assistance as the voluntary societies concerned may find themselves able to afford

THE HEALTH ORGANIZATION OF THE LEAGUE OF NATIONS

[FROM OUR CORRESPONDENT AT GENEVA]

AT the meeting of the Assembly of the League of Nations at Geneva on September 20th, Dr R V Caballero, the delegate for Paraguay made a statement on the Health Organization of the League

He stated that under the auspices of the League training courses in epidemiology and sanitary practice had been established during the past year in certain towns of Eastern Europe (Warsaw, Kharkov, and Moscow) an inquiry had been conducted in Russia into the efficacy of vaccination per os against cholera, dysentery, and typhoid fever, and a mass campaign in favour of vaccination had been carried out in Greece at the request of the Greek Government A service of epidemiological information had been created, and was now in regular correspondence with the sanitary administrations of 26 European states, 13 American republics, 16 African colonies, 12 countries in Asia, and with Australia and New Zealand Epidemiological and statistical researches of a more special nature regarding notification of cerebro spinal meningitis, the incidence of scarlet fever and diphtheria, the area of extension of Asiatic cholera, rhinoscleroma, leprosy, tuberculosis, and cancer were at present being undertaken

Special attention had been given by the Health Organization of the League to the problems, both prophylactic and therapeutic, connected with sleeping sickness in Central Africa A committee of experts had been appointed to study these problems, and this committee would present recommendations intended to serve as a basis for agreements to be concluded between the British, Belgian, French, and Portuguese colonies, which would provide means of effectively combating this terrible scourge A special committee had also been appointed under Professor Léon Bernard of Paris, to study the question of instruction in health and social medicine in Europe, America, and Japan The activities of the Organization had not been confined to epidemic diseases It had also studied, on a large scale and from its international aspect, the question of the campaign against malaria A committee on malaria, comprising specialists of various countries, including two—Germany and Russia—which were not members of the League, had been constituted for the purpose of studying the best prophylactic and therapeutic methods This committee was to carry on investigations in the countries most subject to malaria It had already visited this year the Serb Croat Slovene State, Greece, Rumania, Bulgaria, Russia, and Italy It was thus able to form an idea on the spot of the difficulties experienced by the various local administrations in combating malaria An allied question was that of the production of quinine, the co operation of four experts belonging to different countries had been secured, and they had undertaken the task of examining problems connected with the manufacture and supply of this drug and the other cinchona alkaloids An international conference on quinine was to be held as soon as sufficient scientific data had been collected

In speaking of the international exchange of sanitary personnel and specialists, Dr Caballero said that in 1924 the number of officers taking part was 99, and they belonged to twenty nationalities The number of general annual interchanges had been fixed at four, for a duration of about seven weeks, each interchange to comprise a maximum of twenty persons Two special interchanges (malaria, tuberculosis, *school hygiene*, and statistics) had also been arranged for annually, with a maximum of ten persons for each interchange

The Health Organization had also begun to examine the extremely delicate problem of drafting Health Conventions on problems which extended beyond national limits and became questions of international *public health* A proposal was at present being considered from the Netherlands Government, relating to *libre pratique*—that is, the exemption of vessels which have received health certificates in a properly equipped port from further sanitary inspection when they touch *other ports* The proposal is being studied, but the *feeling is that* the time is premature for a general application of such a *procedure* A model health convention regulating traffic on waterways of international concern was now under consideration The final diplomatic signatures were now being exchanged for the ratification of the Health Convention concluded between Austria and the Serb Croat Slovene State (This Convention is the last of a series of seven drafted as the result of the Sanitary Conference held in Warsaw in 1922, and intended to act as a "sanitary barrier" in Eastern Europe) The important work on the standardization of serums and biological products* had been continued

In conclusion he pointed out how undesirable it would be to curtail the estimates for the health work of the League, and stated that in the committee which had been considering the subject the British, French, Italian, Brazilian, and Japanese delegates had all supported the proposal to continue the international exchange of sanitary personnel and *specialists*

After a brief discussion the Assembly passed unanimously a series of resolutions These approved the work generally, especially of the service of epidemiological intelligence and public health statistics, and the results obtained from the carrying out of the system of interchanges The Assembly considered that the most valuable results might be anticipated from an inquiry which has been undertaken into mortality from cancer, and praised the work of the Malaria Committee

Further resolutions which were carried approved the establishment of a bureau of epidemiological intelligence in the Far East, requested the Health Organization to take into consideration the study of the problem of physical education and to investigate the means for its general extension on rational principles, and further requested the Organization to undertake an inquiry into the value of preventive measures against tuberculosis This last proposal was on the initiative of Professor Pitamic, delegate for the Serb-Croat-Slovene State, and his idea was to have an inquiry similar to that already undertaken in respect of malaria and other diseases

* We hope to publish a more detailed account of this prolonged and complicated work in a future issue

British Medical Journal.

SATURDAY, SEPTEMBER 27TH, 1924

THE SURGICAL TREATMENT OF ANGINA PECTORIS

During the last twenty years excision of the cervical sympathetic has been advocated for a number of diverse diseases. Although the results in a large proportion of the conditions for which the operation has been performed have proved useless or disappointing the brilliant work of Jonnesco and others has demanded increasing attention. The numerous important publications of Jonnesco and the recent lecture delivered by Professor Wenckebach[1] have awakened great interest and introduced the profession to the possibilities of surgical relief for the distressing symptoms of angina pectoris. The wide interest which has been aroused may in some measure be estimated by the appearance in current literature of a number of important contributions to our knowledge regarding the structure and function of the sympathetic nervous system, and by the publication of numerous articles upon the surgical technique in the operation of sympathectomy. We publish to-day (p. 553) a contribution by Professor Danielopolu of Bucarest in which he discusses the physiology and pathology of the production of anginal symptoms. He adduces arguments in favour of the surgical procedure of section of the sympathetic chain and opposes cervical sympathectomy.

Recently, however, A. E. Halstead and F. Christopher of the University of Illinois Medical School have reported[2] a case of angina pectoris relieved by partial cervical sympathectomy, and have placed on record a modification of the approach recommended by Jonnesco. In order to reach the cervical sympathetic they prefer to make an incision along the anterior instead of the posterior border of the sterno-mastoid, and then retract the muscle and the carotid sheath with its contents posteriorly rather than anteriorly. On anatomical grounds this procedure appears to present distinct advantages because the approach to the cervico-thoracic ganglion is rendered more direct and greater freedom for manipulation is permitted. As it is this stage of the operation which offers the most formidable difficulties, any advantage at this point is of the greatest value. Apart from this modification, Halstead and Christopher performed a partial cervical sympathectomy, the middle ganglion alone being removed by avulsion. Although a number of surgeons have now reported successful results after excision of one ganglion or even division of the sympathetic cord, Jonnesco in a recent monograph expresses disapproval of the limited procedures and states that total resection of the cervico-thoracic sympathetic is the only intervention really indicated. This decision was probably arrived at owing to the complex arrangement of the branches of the sympathetic, and to our incomplete knowledge of the nervous pathways involved in the manifestations of angina pectoris.

In addition to indicating some of the difficulties at present confronting us with regard to the surgical treatment of angina pectoris the question must also be raised of the serious sequelae which may follow such an extensive excision. Several deaths have followed complete sympathectomy, and it is clear that a more conservative operation is to be preferred. To make sure of interrupting a sufficient number of the afferent cardiac fibres by total removal of the cervical sympathetic very widespread and profound consequences must be risked, and Wenckebach has stated that the ideal operation would be to divide the afferent fibres from the heart and aorta and leave the efferent intact. With this end in view what is thought to be the depressor nerve in man has been divided on several occasions with beneficial results. Unfortunately, further experience has proved that this nerve is extremely variable in man, and quite frequently recognition of it has been impossible.

The irregularity and inconstancy of this nerve render impracticable what theoretically appears to be the ideal operation, and until anatomical and physiological researches are more advanced we are forced back, at any rate temporarily, to a consideration of the more drastic procedure of cervico-thoracic sympathectomy. In this operation, after retraction of the sterno-mastoid and carotid sheath, Jonnesco exposes the large superior cervical ganglion resting on the deep aponeurosis, and when its connexions have been divided, turns it down and traces the sympathetic cord to the middle ganglion, which is much smaller and less easily located. The prominent anterior tubercle of the sixth cervical vertebra and the inferior thyroid artery offer useful landmarks for finding the middle ganglion. When this has been freed, the sympathetic cord is followed to the cervico-thoracic ganglion, which is to be discovered between the transverse process of the seventh cervical vertebra and the neck of the first rib on the inner side of the superior intercostal branch of the subclavian artery. The inaccessible position of the inferior cervical ganglion and the variations in its connexions and extent of fusion with the first dorsal ganglion render this part of the operation extremely difficult.

The publication of cases relieved from the most urgent symptoms of angina pectoris by excision of the cervical sympathetic is likely to tempt many surgeons to consider the operation, and this temptation is likely to be increased by the impression created by some of the advocates of the operation that it is quite a simple procedure. Reference to a dissection of the neck is sufficient to convince most that the later stages of the operation are exceedingly complicated and delicate, and a study of the variations in the distribution and connexions of the cervical sympathetic will at least indicate some of the difficulties to be surmounted in addition to those obtaining in the mode of approach. It is clear from the writings of the pioneers in this important field of surgery that considerable research upon the structure and function of the cervical sympathetic and the nervous pathways to and from the heart and aorta has yet to be completed before a surgical treatment of angina pectoris can be devised which may be practised widely with any degree of certain success. It is to be hoped that the inspiring work already done will not be discredited by impatience. Contributions such as the recent one by Halstead and Christopher help to demonstrate and simplify some of the difficulties of surgical technique, but the anatomist, physiologist and pathologist have urgent duties to perform towards the solution of the fundamental problems which have been raised by the pioneers in this branch of surgery.

THE ROYAL COMMISSION ON NATIONAL HEALTH INSURANCE

THE indifference shown by the public, even by the educated and interested public, on the announcement of the composition of the Royal Commission on National Health Insurance is remarkable and significant. At the time when the profession secured from the late Minister of Health the promise to appoint a Royal Commission to investigate and report on the whole system established under the National Health Insurance Acts a considerable amount of public interest was shown, and not only the medical profession, but politicians and many others concerned with social welfare and local administration welcomed the Minister's action as calculated to ensure an authoritative and judicial inquiry into a subject of great national importance and promise. Later, the terms of reference to the Commission, as settled by the present Minister of Health, were accepted by the medical profession and recognized by organs of public opinion as allowing of the wide and momentous inquiry expected.

There were those who thought, or seemed to think, that the best kind of Royal Commission to conduct such an inquiry was one composed of representatives of the various classes of persons who had been hitherto concerned with National Health Insurance administration or work. This view was combated by the Insurance Acts Committee and the Council of the British Medical Association, and was not accepted by the late Minister of Health. It was definitely understood that the Royal Commission to be appointed should be small, authoritative, and impartial. The need for making these requirements is clear. A large Commission would be most unlikely to result in the unanimity of report and recommendation which is almost essential if, three years hence, there is to be any practical advance on the present state of affairs. Such a report, even if unanimous, would have the impetus of public opinion behind it only if it were recognized by the public from the beginning that those who signed it were men and women whose opinions could be accepted as having undoubted weight and authority, and who had entered upon and pursued their inquiry in an unprejudiced fashion, uninfluenced by previous public utterances or professional pronouncements which they were concerned to defend.

The evident disappointment of the profession and indifference of the public when the actual appointment of the Commission was announced is probably a reflection of the feeling that the present Minister of Health has taken, not a wide, but a narrow view of the essential purpose of the Commission or that the actual composition of the Commission is such as is not likely to lead to a satisfactory, authoritative, and fairly unanimous conclusion—or perhaps of both these feelings.

We have no wish to speak in the least disparagingly of any member of the Royal Commission. Several are eminently suitable in every respect and we have no doubt that all are entirely worthy persons who will devote their thoughts and energies wholeheartedly to the work which they have undertaken. It is, however, obvious that certain things may be said, and we think should be said, of the Commission as a body. It is remarkable among Royal Commissions in not containing a single person trained and experienced in cross examination and skilled in the particular kind of investigation to be undertaken. It contains a number of persons entirely unknown to the general public and even to the public which concerns itself particularly with the matters to be inquired into. It is, of course, quite possible that these individuals may prove to be among the best members of the Commission in the actual investigation, but they clearly detract from the weight which the conclusions of the inquiry will carry in the public estimation. Several of the members of the Commission have been concerned at a recent date in the work of administration under the National Insurance Acts, or have committed themselves emphatically and publicly to particular views on fundamental points connected therewith. There seems, too, to be a disproportionate number of members with a particular bias in the view they take of social questions. There is one member—Sir Alfred Watson—who has, from the beginning, been professionally responsible for the actuarial calculations and financial estimates and data on which the whole Health Insurance system is based, and whose opinions, delivered from the position of unparalleled and unchallengeable authority which he occupies in the Government service, have from time to time been the cause of considerable difficulty or controversy. It is possible that all he has said may be right, or at least quite justifiable in the circumstances of the time, but there may have been some occasions on which he was not so happily inspired. It will be one of the tasks of the Commission to pass under review the work and functions of the bodies—central as well as local—which have been concerned in administering the existing scheme, and it is improper that individuals who have been professionally responsible for, or even prominently concerned in, this work should have a place upon the Commission itself. Their presence must almost of necessity create difficulties in the investigation, and to some extent vitiate the conclusions that may ultimately be arrived at. Their proper place should surely be as essential and invaluable witnesses, and not on the judgement seat. Faced with the difficulties of personnel we have enumerated, it will indeed be a personal triumph for the chairman if he should produce any report which will command general consent. We sincerely hope that the disadvantages will be overcome, but they should never have been created.

The real question with which the Royal Commission should be concerned is the *relation of a national* insurance scheme to the public health. The scheme established by the Act of 1911, and adjusted by succeeding Acts and Regulations, is admittedly tentative, limited, and imperfect, but the Conference of Local Medical and Panel Committees and the Representative Body of the British Medical Association have alike declared "that the measure of success which has attended the experiment of providing medical benefit has been sufficient to justify the profession in uniting to ensure the continuance and improvement of an insurance system." Opinion outside the profession seems also to be almost unanimous in a similar general sense. The relation of any amended or extended insurance system to the other services relating to public health, especially to hospitals and to those clinical services under the auspices of public authorities which have developed hugely since 1911, is one of the vital questions which *affect national life* and professional tradition and activity. Yet we have direct evidence that this fundamental aspect of the matter has never been considered, or even conceived, by the present Minister of Health. It seems not to have been in his mind at all in selecting the members of the Commission. The smaller, even trivial, aspects of the matter, such as possible conflicts of opinion between

officials of approved societies and insurance practitioners appear to occupy his mind to the exclusion of wider and more important questions. Not only has he failed to grasp a great opportunity, but he appears not to have realized that any such opportunity presented itself. Yet this was obvious to all who were anxious to promote the public health in their several spheres, and many persons not only in the medical profession but in approved society and insurance circles, and among members of public health and education authorities had looked forward to it with the hope of fruitful and important results.

Whatever may be the opinion of some approved societies officials about some aspects of medical benefit, and whatever may be the opinions of many doctors about approved society administration as presented to them by their patients, it would not be surprising to find a considerable agreement on essential matters between the evidence that will be presented to the Commission by approved societies and that given on behalf of the profession. At any rate in spite of disappointments and although minor points will not be overlooked the evidence which is being prepared for the Commission and will be given by the Insurance Acts Committee and the Association will be concerned primarily with these fundamental and vital questions, and it is still to be hoped that the Commission itself and the general public will realize both their importance and the urgent need for their determination.

TREATMENT OF MENTAL DISORDER

VARYING opinions have been expressed as to how far it is feasible or useful to devote special wards in general hospitals to mental cases, and we publish this week at page 551 an important contribution to this problem by Dr John D. Comrie in which he gives an analysis of 500 cases of mental disorder treated in the Edinburgh Royal Infirmary. Though these mental wards have been in existence for some years this fact is probably not generally known, and Dr. Comrie has done a distinct service to psychiatry by giving it prominence. So important a development deserves wide publicity, because the large number of cases admitted in a year indicate that it meets a very real need, and also because the results of their treatment make it abundantly evident that the general hospital has a wide sphere of usefulness in regard to milder or undiagnosed cases of mental disorder.

It is hardly possible to conceive of a more effective method of bridging the gulf which exists between psychiatry and general medicine than that which aims to treat mental cases in a hospital dealing also with surgical and medical cases. Under such conditions the student will obtain an entirely different impression of the psychoses from that gleaned during a few demonstrations in an asylum, though naturally these should be included in his curriculum. In a hospital in which mental diseases are treated the student will meet daily with these conditions side by side with physical diseases, as he will most certainly do as he passes from one house to another in his practice hereafter he will, moreover, discover that the psychoses demand the same methods of biological examination as he is taught to apply to physical diseases and need similar methods of treatment. It may be that he will learn, too, from his daily study of personality in the subjects of mental disorder that the subject of physical disorder also has a personality as well as a body, and that the attitude of the physician, by encouraging or discouraging hopefulness may exert an influence on the course of disease. If, however, the student is only acquainted with the psychoses as met with in the mental hospital especially if (as is the usual practice) he only spends a few hours of his whole medical course in this institution he must tend to gain an erroneous impression of the psychoses as a whole, and to imagine that these conditions are usually associated with chronicity, deterioration, custody, and legal procedures, losing sight of the fact that in many cases are curable and in no sense needing legal detention. We believe also that the association of mental cases with the general hospital will tend to advance our knowledge of the causes of the psychoses and increase our ability to treat them. The services of specialists in all branches of medicine will be available to aid in the investigation of these cases, and it is quite certain that the psychiatrist cannot unaided solve the problems which his patients present.

Already the investigations at the Edinburgh Royal Infirmary have been fruitful and suggestive, and apart from the paper published this week we recall to mind the stimulating work of Dr. Chalmers Watson on the part played by auto-intoxication or auto-infection in mental disorders, the results of which were presented in a paper read before the Medico-Psychological Association in July 1922.[1] It is interesting to observe that Dr. Comrie discovered physical conditions—infective, exhaustive, or reflex—as partial causes in the majority of cases of melancholia, mania, confusional insanity, and psychoneuroses. This may be due in part to the fact that in a general hospital more emphasis would be given to physical factors, and the opportunities for a complete physical examination by the various specialists would be greater than in the mental hospital, but a survey of his clinical material shows that a type of case was treated which is seldom seen in the asylum. Thus a large proportion of his confusional cases were post-operative or associated with definite physical disease. The fact that the cases differ in a large measure from those present to mental hospitals is in itself significant and thoroughly justifies the use of wards for mental cases in general hospitals. Dr. Comrie observes that many of the patients made a good recovery without incurring the trouble and stigma of certification as insane, but that practically all presented on admission, considerable difficulty either in diagnosis or in treatment if that had to be conducted outside an institution. Many cases were obviously treated in an early stage of the disorder, and we think it is justifiable to take the view that if they had not been so treated many of them would have drifted into more intractable and in some cases incurable, forms of insanity. Particularly interesting and important are the patients suffering from simple melancholia many of whom had made suicidal attempts, which were treated in the hospital. It is noteworthy that these suicidal patients appear to have exhibited demonstrable psychotic symptoms, and it would be interesting to know something of their subsequent history. Many of these cases are uncertifiable, and it is probable that if there were greater facilities for the treatment of early cases such as is provided by open hospital wards, a large number of suicides, which cause great distress to their families, would be prevented.

We are of the opinion that the general hospital may in the future play an important part in research, teaching, and treatment in respect to the psychoses. But such functions will be limited in their scope until the lunacy laws in this country are amended, and

[1] *Journal of Mental Science*, January 1923.

it is to be hoped that this very urgent change will soon be carried out Clinics for uncertified cases will still be necessary, since only the milder types of case, and even those for only a relatively short period, can be treated in general hospitals It is most desirable, however, that in the future every general hospital should make some provision for the treatment of mental cases, for the reasons which have been suggested in these comments on Dr Comrie's paper

PSYCHOLOGICAL TESTS IN EDUCATION

INTELLIGENCE tests rank among the most remarkable achievements of modern experimental psychology Their value is being increasingly recognized, though in all probability their possibilities have not yet been fully developed It is claimed that they afford a more objective, systematic, and trustworthy means of discovering the existence of inborn intelligence and educable capacity in pupils than the ordinary oral and written examinations Although, so far, no definition of intelligence has found general favour, yet it is agreed that temperament and character are not comprised in it, and that acquired attainments and limited talent available for only one type of intellectual work must be excluded What these tests of intelligence measure, however, is an inborn and all-round intellectual ability, including both practical and theoretical activities, but excluding processes of emotion and qualities of character We recently gave a preliminary account (July 26th, p 157) of the inquiry into these tests conducted by the Board of Education It is by no means certain that all the tests considered in its published report on *Psychological Tests of Educable Capacity*[1] fall strictly under these headings—for example, the use of the method of "word association" as a test is surely open to the objection that emotional complications are not excluded Generally speaking, however, it is claimed that these tests render it possible to predict from the examination of a quite young child what will probably be his intellectual level when grown up, since the mental factors so investigated are thought to remain more or less constant throughout life It is believed that the ratio between the child's mental and chronological ages ("mental ratio" or intelligence quotient) remains unchanged during the years of growth, thus furnishing a guide to the degree of education that is possible, and indicating the form of teaching which will be most fruitful The nature of the investigations on which the Consultative Committee of the Board of Education based the conclusions contained in the report was described in our previous notice of the volume, which contains an historical sketch of the development of psychological tests, prepared at the request of the Committee by Dr Cyril Burt The Binet-Simon scale and its modifications are considered critically and in detail, and standardized tests of scholastic attainment, tests of vocational aptitude, and of temperament and character, receive attention The various types of psychological tests in connexion with examinations intended primarily to estimate ability are set forth and the use of these tests in elementary, junior technical, central, and secondary schools is considered The value of standardized scholastic (educational) tests, physical tests, tests of memory, perception, and attention, and temperamental tests, are discussed in their bearing on educable capacity Provision of facilities for the instruction of school teachers in experimental psychology is recommended, with special reference to the theory and practice of these tests, and it is considered desirable to take steps to co-ordinate and organize research, and to distribute information bearing on the application of psychological and statistical methods to education A central committee or clearing house, analogous to the National Physical Laboratory, is advocated to arrange for continuous investigation in various fields over a number of years The refinement and standardization of these tests can, it is thought, only be effected by the combined effort of a large body of co-operating investigators Dr James Drever, Combe Lecturer in Psychology in the University of Edinburgh, suggested that mental testing should be undertaken as a supplement to the medical inspection of school children, and that each educational area should have its own psychological clinic in close connexion with the schools, employment bureaux, and appointments committees These clinics would also be in touch with the psychological departments of universities and with the National Institute of Industrial Psychology Details of the tests employed in various countries and the views of several psychologists on the factors involved in "general" ability, and the need for testing for "special" and "group" abilities, are given in appendices The classified list of recent publications on psychology and psychological tests in Appendix VII, prepared by Dr Cyril Burt, deserves special mention as providing valuable guidance for those who wish to study these matters further

HOSPITAL ACCOUNTS

ADMINISTRATORS of hospitals are under a debt to Mr Joseph E Stone, the accountant to St Thomas's Hospital, London, for his book on *Hospital Accounts and Financial Control*[1] As Sir Arthur Stanley writes in a foreword "The increasing complexity of modern hospital administration and the necessity of obtaining the utmost value out of every penny of income has brought the subject of hospital accounting and financial control very much to the front during the past few years It is now generally recognized that accounting is an integral part of hospital administration, and I can vouch from personal experience to the immense value of up-to-date scientific accounting in the administration of a hospital The book rightly emphasizes the importance of internal financial control, and it outlines methods necessary to be adopted if efficient control is to be exercised at all times and in all departments and activities of the hospital" Sir Basil E Mayhew, a distinguished chartered accountant, in an introduction, points out that to a large extent the "Revised Uniform System of Accounts" (established for the purposes of the King Edward's Hospital Fund, and valuable in its way), is responsible for the stagnation in hospital accountancy The system has been supposed to meet all needs, whereas it was based upon the simpler conditions of yesterday The basis of the system advocated by Mr Stone is that known as "costing" It is one well known in every large commercial business The larger and more complex the business the more necessary becomes this system, otherwise leaks that may occur in individual departments may bring the whole structure to the ground Costing means that for each department there is kept a statement of accounts to which there is debited every expenditure incurred by that department, with its share of the general overhead charges By that means the profit or loss accruing from that department is known, and the need for the reform or elimination of that department ascertained Since in hospital working there is no profit to be made it may be objected that such a system is out of place, but the principle holds good for all that, since unless there is this definite knowledge of the separate costs of each department it cannot be ascertained whether each is keeping within the limits set by the total income of the hospital It may be that one department is

[1] *Hospital Accounts and Financial Control* By Joseph E Stone Incorporated Accountant London Sir Isaac Pitman and Sons Ltd 1924 (Sup roy 8vo, pp xiv + 156 21s net)

absorbing so much of the vital financial energy of the whole that it acts in effect like a malignant growth upon the body of the patient, whereby so much of the essential vitality is diverted as to bring about death. Mr. Stone has given detailed statements of how this costing system may be carried out, and without unnecessarily cramping the freedom of the members of the organism he shows how it may be adapted to the great hospitals, and how to the smaller cottage hospitals. His claim is a challenge to every hospital administration. It is one that cannot be ignored, and must be taken up and investigated by each hospital, and either approved and adopted or cause shown why the administration declines to do so. It is certain that without some such system as this the board of a hospital is not master in its own house, for without it the board cannot know what is being done in its name. Besides, there is valuable information upon such matters as income tax, but in this Mr. Stone might have been a little more up to date, for he gives no information upon the means whereby tax paid by benefactors may be recovered for the benefit of the hospital.

YOUTH IN MEDICINE.

IT has become a habit since the war to laud the superiority of youth, and to minimize the advantage of judgement, which was formerly supposed to be acquired by the experience of age. In response to this attitude the *Weekly Westminster* is publishing a series of articles on "What the younger generation is doing," and has followed up disquisitions by Mr. Nigel Playfair on dramatists, and Mr. Humbert Wolfe on poets, by producing (in its issue for September 20th) the views of Dr. Harry Roberts on the younger doctor. Dr. Roberts begins by asking three questions. "Is there, in the medical profession to-day, a spirit differing in essence from that of thirty years ago?" Do the men who have received their medical diplomas within the last decade differ essentially in outlook or technical equipment from their fathers and uncles who followed the same career?" "Among these younger men, are there any outstanding individuals who, by reason of inspiration or special insight, are in a position to lead their seniors?" Dr. Roberts finds difficulty in answering his own questions, because Medicine is a term which covers a science, a philosophy, and a craft; but he finds little reason to believe that in craftsmanship the best surgeons of to-day are superior to the best surgeons of a century ago. In science Dr. Roberts states that the true inspirers of the new physiology and the new psychology are stout, grey bearded gentlemen in no way products of the last decade. As for philosophy, the majority of medical students and doctors neither hunt for nor recognize readily general principles, in fact, philosophy is to them a closed book. The majority varies little from generation to generation. "The average fine old-fashioned doctor and the average smart young medico, with his mouth full of psychoanalysis and endocrinology, are cerebrally indistinguishable." These views must seem depressing to the younger men who won the war which has been attributed by some to the folly of the greybeards. Dr. Roberts, however, has faith in minorities, especially in a minority which he thinks has grown rapidly in the last fifteen years—a minority of "competent and intelligent practitioners who seriously regard their work ... are ever eager to understand the rationale of their technique ... and are intelligently critical of traditional postulates and dogmas." These men, he says, now form a much bigger proportion of the whole, and in a very short time he thinks they will no longer be a minority—they are "the heirs of all that revolutionary knowledge which the last twenty years have given us." Dr. Harry Roberts does not seem to us to have answered his three questions, but he ends with the optimistic opinion that, in spite of all the practical limitations and the still long distance from the goal, "the science and art of medicine, as represented by their responsible exponents, stand higher to-day than they have stood for two thousand years." It may be doubted whether any useful purpose is served by attempts to separate into categories the different ages of man, notwithstanding the precedent set by the melancholy Jaques. The procedure is, perhaps, especially dubious when adopted by a medical man, who knows well enough that in the development and decay of the individual human mind no such hard and fast lines can be drawn, while from history it is clear that the present generation can hardly claim to be superior in intelligence to all their forerunners through the ages. Dr. Roberts's article has one merit, in that he appears to recognize to some extent that what is talked about as "progress" is not necessarily progress of the human mind but often is merely progress in the invention of instruments to help human activities. The main difference between the medical graduate of the last decade and his uncle is probably to be found in his technical equipment.

THE HEALTH BUDGET OF THE LEAGUE OF NATIONS

ELSEWHERE (p. 582) we give a report from a Geneva correspondent of the speech to the Assembly in which Dr. Caballero commended to the delegates the work of the Health Organization of the League of Nations. What the League has done and proposes to do in the promotion of international health was approved without dissent, but the discussion on Saturday last did not touch the all important question known as "credits," which has still to be considered, at the moment of writing, by the Assembly. The League of Nations includes a body called the Supervisory Commission, of which all the departments stand in awe. This body is concerned with the finance of the League, and as regards the health activities with a careful and calculating eye. It is disturbed because these activities bulk more largely in each annual budget, and it thinks the time has come to decide on a maximum sum beyond which the Health Section must not go. This sum it has put down as 750,000 Swiss francs, equal at the present rate of exchange to about £32,000, and it is to be left to the officials to distribute the amount as they see fit among the various health activities to which the League is committed. The Supervisory Commission points out, in a semi apology for the relative smallness of the sum, that the health work of the League is not a temporary measure which like the work on behalf of refugees, for example, may be expected to diminish in extent, but that it is a permanent commitment, and whatever is voted must be looked upon as an annual charge. The Commission has examined certain proposals which would have had the effect of adding 50 per cent. to the health expenditure, and two of them appeared to be so desirable that in spite of the economical considerations already advanced the Commission felt constrained to recommend them to the Assembly for adoption. One of these is to raise the annual amount spent on sanitary notifications and notifications in the case of epidemics from 10,000 to 15,000 francs. The other is to increase the sum allocated to the interchange of public health personnel in connexion with the system or liaison between the various national public health services from 75,000 francs, at which it has stood hitherto, to 150 000 francs. Other proposals which were made but which did not commend themselves to the Commission, were an increased allocation for special investigations on health matters, and a new departure in the shape of technical health conferences, on which it was proposed to spend 50 000 francs a year. The Assembly, which will last some days longer, has the deciding voice on these proposals, but it is not likely to cut across its Supervisory Commission.

TUBERCULOSIS IN DOGS AND CATS

TUBERCULOSIS in the domestic animals is always of interest to the medical man In the larger mammals and in milk and meat its possibilities are obvious and the necessary precautions can be taken In the domestic carnivores, however, the danger is more insidious and in some ways more acute Although in the cat tuberculosis is most commonly of the bovine variety—from its milk diet—the disease in the dog is often contracted from human sources The dog is by nature a scavenger, and frequently has access to tuberculous expectorates and other infective material He is often allowed every opportunity of conveying the disease thus acquired to man, and especially children It was at one time thought that tuberculosis was uncommon in dogs, but modern research has shown that this is far from being the case Verge has recently given a comprehensive review of this subject[1] Clinical diagnosis is far from easy suspicious symptoms are numerous—progressive emaciation, accelerated respirations, dyspnoea, and so on, but the differential diagnosis presents real difficulties The tuberculin test—so useful in the larger animals—is very uncertain in dogs and cats The only certain methods of diagnosis are experimental The demonstration of the bacillus in excreted products is sometimes easy, more often very difficult Verge points out that experimental inoculation of guinea-pigs and rabbits is the best way, the latter animal is peculiarly adapted for demonstrating tubercle bacilli of canine or feline origin[2] Deviation of complement has also given good results While diagnosis is difficult and often unsatisfactory, it is well to recognize the risk which is run from infected domestic animals Bacilli are excreted in many ways—in the saliva and sputum, in the bile, faeces, and urine, and even by the skin—and such dogs and cats constitute a grave danger, for there is no doubt that animals contracting the disease from man are capable of reinfecting man This is a source of contagion at least as important as milk and other more obvious methods, if only from its insidiousness and the extreme licence which is given to pet dogs and cats, even in otherwise hygienic homes

THE PROPHYLAXIS OF DIPHTHERIA

THE Health Organization of the League of Nations has recently published a document entitled *The Prophylaxis of Diphtheria*,[3] written by Dr Louis van Boeckel, director of the laboratory of the Belgian Public Health Department Judging from the list of subjects which have been dealt with previously by this organization, it would seem that its object is to select problems of international importance, to collect information of experience gained in different countries, and to issue short monographs incorporating new knowledge which may be supposed not yet to have found its way into textbooks The document relating to diphtheria certainly deserves to be called international, as witness the 340 references of the bibliography English readers will find no novel matter in this monograph the volume on diphtheria issued recently by the Medical Research Council has even more to say on this subject We may therefore content ourselves by calling attention to what it contains Its first part deals with the determination by the Schick test of the susceptibility of individuals to diphtheria, and contains an excellent account of the method for carrying out the test and of what may be expected from it For readers unfamiliar with the test some illustrations of the different types of reaction would have made the text more easily understandable The second part is concerned with active artificial antidiphtheria immunization, particularly with the toxin-antitoxin mixture, and gives concise directions for this prophylactic treatment For the third part the author has wisely chosen the question of the popularization of these new methods This is a problem still to be faced by all countries We are watching with great interest the extensive campaign which has been inaugurated by Park and his fellow workers in New York Park introduced the system of antidiphtherial immunization first of all in the New York schools The attention of the headmasters was drawn to the value of the method by the Director of Education, and a doctor from the health service furnished the headmaster with full details An official circular pointing out the dangers of diphtheria, describing the advantages of immunization, and requesting the parents to allow their children's susceptibility to diphtheria to be tested and immunization undertaken, was distributed to one million children attending the schools It is said that most susceptible school children in New York have now been vaccinated, and that Park's method has been adopted, not only in New York, but also in most of the great centres of the United States But the Health Organization of the League of Nations does well to remember that methods of propaganda suitable to one country may not be so successful in another This thought seems to have been in the mind of the author of this report, who concludes in the following words "However much we may admire the enthusiasm with which the campaign has been initiated and carried on in the United States, we fear that the older continent of Europe may be loth to accept a campaign in favour of antidiphtherial vaccination carried on with the same vigour as that witnessed in America Let us first of all enlighten the medical profession, and then the public, as to the advantages of the new system of antidiphtherial prophylaxis, and let us apply this system wherever a careful study of the epidemiological situation convinces us *that it* may be resorted to with advantage"

WE have to announce with much regret the sudden death on September 22nd of Dr Sidney Martin, F R S, senior physician to University College Hospital and professor of clinical medicine at University College Hospital Medical School

---

THE service of thanksgiving, forming part of the jubilee celebrations of the London (Royal Free Hospital) School of Medicine for Women, will be held at St Paul's Cathedral at 2 30 p m on Saturday, October 25th On the previous evening a festival dinner will be held in the Guildhall

---

SIR ROBERT BLAIR, although he has retired from the post of education officer of the London County Council, still maintains his active interest in education He is one of the candidates for the chairmanship of Convocation of London University, and he appears to be very strongly supported His election would bring to Convocation and the University a wealth of educational knowledge and experience, and from the valuable support he gave to the medical staff in the service of the London schools it may be assumed that he would serve well the interests of medical education and medical graduates

---

THE nomination of candidates for the parliamentary by-election for the University of London has been fixed for Wednesday, October 1st at 11 a m at the University, and polling will take place from Monday, October 13th, to Friday, October 17th The voting is by voting-papers sent to all graduates on the parliamentary register by the Vice-Chancellor

MOTOR NOTES FOR MEDICAL MEN

By H MASSAC BUIST

Eve of the Motor Shows

The yearly International Paris Automobile Salon opens in the Grand Palais, off the Avenue Champs Elysees, on Thursday next, October 2nd Apart from members of the French industry, there will be an aggregate of thirty foreign exhibitors, of whom four only are of British origin —namely, Austin, Morgan, Morris, and Rolls-Royce the actual Morgan exhibited being a machine built abroad under licence from the British originator

The eighteenth Annual International Motor Car Show promoted by the Society of Motor Manufacturers and Traders at Olympia will open under the patronage of the King on October 17th The public will have access to it daily, Sunday excluded, until the 25th By contrast with the Paris Exhibition, the London one will retain the distinction of being beyond challenge the most thoroughly representative of the world's motor car manufacturing industry, nothing approximating to such an absolutely representative international character being organized elsewhere Thus there will be no fewer than 128 exhibitors of cars, 25 exhibitors of tyres, and 284 exhibitors of accessories and components, apart from which no fewer than 57 carriage builders have been allotted space in the enlarged building By reason of our Free Trade policy, which is singular among the nations possessing motor car building industries this country is the motor mart of the world, America, with her high tariff wall having aimed always at keeping out foreign products In effect, the best examples of motor car design and manufacture in the world are on our market and will be represented at Olympia, together with several examples of the undesirable Therefore, no medical man need consider it necessary for him to journey to Paris next week in order to inform himself concerning the new style motor cars introduced for the 1925 season

Notable Developments of the Year

While it is still possible to add accessory to accessory in the equipment of a car there is no gainsaying that some standardized machines have become overloaded, though under this head the owner will necessarily follow his own inclination It is impossible to offer any useful expert advice beyond suggesting that every user should put to himself the question "Is it essential that I should have this gadget, or that, and, if I must have one, or both, what, if any, power will they absorb in the way of current from the batteries, and so forth?" Electric screen wipers, cigar lighters, signal horns, and so forth are very convenient, but how many owners are aware that a signal horn, for example uses more current in ordinary car service than is absorbed from the battery when starting the engine? Perchance under this head the average medical practitioner's use would be different from that of the ordinary member of the public in that generally, the family doctor has to make short journeys on commencing each of which he has to start his engine by mechanical means But in adding an electrical accessory to a car one should always have in mind the current it will necessarily use and especially the need for inspecting the wiring at frequent intervals in that the slightest leak may lead to a costly bill on account of repairing or replacing the battery

Much experiment has been devoted this year to continuing the investigation of four notable problems—the application of brakes to front wheels, the furtherance of fabric bodies of light weight, the standardization of low pressure, large section pneumatic tyres and the possibilities of forced induction, generally called supercharging with a view to obtaining more power from an engine, primarily for aircraft service, to enable the 'ceiling" to be raised The last named development does not concern the medical man at the moment beyond his noting that, in the case of the first British engineering house to give attention to the use of supercharging mechanism experimentally, a very important stage of progress has been arrived at which may render it possible presently for the supercharger to be of service to the user of a standard car Briefly, last year foreigners used supercharging for the French series of Grand Prix race and other first-class tests of the kind, employing gear that is not only complicated, expensive, and extremely unreliable but which is also required to run in some cases at 20 000 revolutions a minute In short, this is scarcely commercial practice

Last Saturday's Supercharging Demonstration

But in engaging in this year's Grand Prix race Sunbeam has experimented with a supercharger wherein a Roots type of blower is used which is run no faster than crankshaft speed The results obtained not only enabled the manufacturer to achieve the fastest circuit, but also the fastest speed over the measured course, each by two different Sunbeam machines, in the course of the first International 500 miles Grand Prix of Europe road race The accessory, besides, adds 33 per cent to the power output of the engine when it is running at high crankshaft revolutions and it adds no less than 50 per cent at lower crankshaft revolutions Moreover, no trouble was experienced by the firm with this sort of supercharger in that race nor when Mr Louis Coatalen, the chief engineer, applied it to the small 1 500 c.c. 4-cylinder engined Darracqs run in the Junior Car Club's 200 miles race on the track at Weybridge on Saturday last, wherein that make broke world's record the three machines covering the distances at over 102 miles an hour mean speed, each with power plant that would be rated at 10 to 12 horse power for Treasury taxation purposes In this connexion it is interesting to note that the weight of the blower used on these engines was 35 lb only Thus we have arrived at the point at which it is possible to apply a supercharger to an engine (1) of a weight that is commercially practicable, (2) which functions at a normal speed because it does not turn any faster than the crankshaft of an engine, (3) which can be designed to increase the horse power developed by an engine to a greater extent when the crankshaft is running slowly than when it is running fast, and (4) the cost of which is practicable commercially Being interpreted, this means that a given power plant so equipped is able to get a car away either from a stand or from a traffic slow-down, with unprecedented efficiency It we are to deal with the long-standing problem of the gearbox, and to enjoy a chance of eliminating it, plainly we must increase enormously the flexibility of the engine In particular, it must be possible for it to develop very much more power when the crankshaft is turning slowly This is what this form of supercharger renders possible At the moment, however, the matter is to be regarded as still in the experimental stages merely We must not expect the gearbox to be eliminated right away by this means, though there will be early and immature attempts in this direction almost assuredly in face of the Sunbeam and Darracq successes An automobile engineering house of such repute, however, would not proceed in this direct on until it had years of further experience of the problem

Balloon Types in Service

The fabric-covered body is a development which was described in these columns in detail last year It has been taken up since by a large number of manufacturers here as on the Continent, and some American car builders are also standardizing the scheme, though none of these particular examples is likely to be placed on the British market this year In any case, the only point to mention in this connexion on the present occasion is that a large number of chassis builders will be showing such bodies manufactured under licence, and designed specially for their particular vehicles at the forthcoming Olympia show

There, too, it will be found that a number of car builders in this country, as on the Continent and in America, are standardizing what are variously styled "low pressure," "balloon," or "comfort" tyres Necessarily the medical man is interested in this matter, since anything that makes for enhanced comfort of riding is of importance to him as saving fatigue, and, notably, giving his hands the best opportunity for being in a sensitive, as distinct from a numbed, condition, in which latter state they are apt to get

as a result of driving cars that are coarse It would be correct to state that millions of words have been written and printed for and against so-called "balloon" tyres Practically all that has appeared is concerned with what the various writers believe to be the theory of the proposition In point of fact the medical man need not bother about such theories because balloon tyres exist to-day as practical appliances, in defiance of many theories on which the pneumatic tyre industry has been working for thirty years past Alike manufacturers and users of balloon tyres are at the present moment divided into two schools at least, each advocating a different principle of construction Many of the things which, we are told by theorists, concern the conduct of chassis so equipped do not in fact occur in practice, or, if they do, it is found that the given characteristics are manifest to a degree that is negligible At the moment one has to record the mere fact that, while a number of car models are standardized with low pressure tyres of large section, nevertheless the automobile engineers of the world accept the proposition with many reserves

Characteristics for the Road

As to the practical application of the principle as concerns European manufacturers to date, it is observable that builders of small cars have standardized comfort tyres for 1925, notably Morris, Rover, Citroen, Renault, and such like, with a number of others The comfort tyre is by no means so much in evidence, however, in connexion with middle size and large cars, though there are exceptions One of the most popular engine sizes for 1925 cars is 3 litres, or 183 cubic inches, which in the best European practice is really a big car class now, whereas in American practice it still represents merely the middle-size car because transatlantic engines do not develop as much power as European ones But the weights of the vehicles are much about the same, and this class of chassis generally represents a full scale four- to five-seat car I have made a point of driving both a British car of world-wide repute and the very latest American six-cylinder car coming within this category, both equipped with comfort tyres—the English one of the wired-on type and the American one of the straight sided sort With the English car, which has absolutely true pivotal steering, a remarkably good suspension system, and so forth, the tyre pressure was about 45 lb to the square inch whereas for this type of machine with its speed capabilities the rear wheels would be pumped to at least 70 lb, and the front ones to 65 lb, with ordinary tyres With the comfort tyre I found the steering so light as to be absolutely unaffected But there is no gainsaying that, in taking corners or bends at speeds well within the compass of the car, it lurched to a degree that was inconvenient to the passengers As far as the American car was concerned it was quite as heavy a vehicle yet the manufacturers of the straight-sided tyre recommended 28 lb pressure only for the front wheels and 32 lb for the back wheels Of course, the American springing system was not equal to that of the British machine because the American car is a type of vehicle designed for service all over the world, therefore it has to be capable of withstanding more severe shocks In the matter of steering, sometimes it answered easily and at other times it wanted the use of both hands to make a right-angle turn One had to employ a deal of physical effort on a gradient which describes a half-circle and which I use for discovering how the gear ratios of different cars work out in practice, therefore I never approach it on my machine at first at twenty miles an hour In this particular case I approached it eighteen miles an hour and found that the American engine and gear ratio enabled this machine to continue easily up the rise, accelerating on top gear, although I did not ever let the car exceed twenty-seven miles an hour

Dragging on Curves and Corners

But in negotiating the given curve with the engine behaving so easily I not only needed great physical effort to steer the car round, I also blamed the company's machine because the back wheels dragged loudly Afterwards we examined them and found that during the negotiation of the curve in question we must have been riding on the upper half of the tyres—that is, on the side, and distinct from the tread proper Apparently the tyres of the front wheels were not deflected to a like degree Throughout the speed was well within the compass of quiet motoring with ordinary tyres With them on such a chassis one could have taken that hill with safety at thirty-five miles an hour In the case of all the big cars that I have tried this year—and I have tested most of the leading designs—I have found that luxurious suspension is obtained without the use of comfort tyres But most of the small cars I have tried during the twelvemonth could be made to ride better

In this connexion the use of the low pressure tyre is certainly interesting and is to be recommended as a cheap solution if the problem is understood properly For one thing, most medical men will appreciate that when the first of the post-war series of small cars was put on the market, whenever a manufacturer or agent wanted to demonstrate his arrived with the ordinary tyres then fitted inflated to low pressures only, of course, this enabled his machine to ride better and therefore to give a more favourable impression But, as was pointed out in these columns at the time, the practice is fundamentally wrong, is unsafe, and is uneconomical of tyres By contrast the properly designed low pressure tyre is intended to be run at the pressures

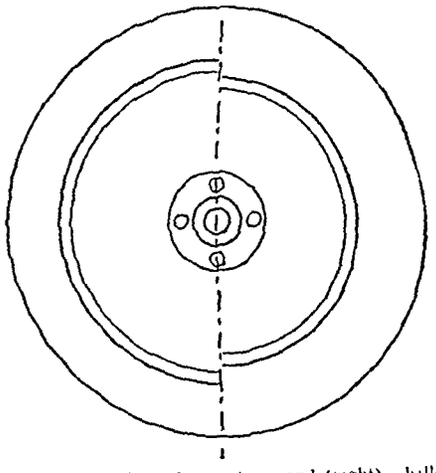

FIG 1—Illustrating (left) ordinary tyre, and (right) balloon tyre

indicated by the tyre maker for the given weight, and is not being used under the wrong conditions at those relatively low pressures which, however, would be entirely wrong if applied to an ordinary tyre For one thing the low pressure tyre must have a wheel rim designed especially for it, because low pressure tyres cannot be effectively fitted to ordinary tyre rims That would upset entirely the gear ratios and, even if one succeeded in fitting such a tyre in such a fashion, one would find it constantly tending to pull off the rim, which is a source of danger Therefore all systems of low pressure tyres at present on the market are designed to require a width of wheel rim proportionate to their retaining section In other words, balloon tyres are not oversized tyres placed on ordinary rims neither are they pneumatic tyres made out of proportion On the contrary, they are designed and made to be entirely in proportion, therefore, for a given car the circumference of a balloon tyre that should be fitted is exactly the size of circumference of an ordinary section tyre but in the case of the comfort tyre a wheel rim is required proportionately smaller in diameter but of greater width than the rim used for an ordinary tyre (see Fig 1)

Contact Area and Speed

A very considerable amount of quite unnecessary confusion is being occasioned in the minds of inquiring car users by the implication that the comfort tyre must take a good deal off the speed of a car and must interfere with the steering because it must be flat by reason of its low pressure In point of fact the alleged flatness of the

discernible to the eye in practice in the case of a comfort tyre inflated as it should be, despite the fact that users of comfort tyres are to be seen driving about the country with these proportionately gigantic pneumatics looking flabby *and presenting quite a flat contact on the road* That, however, is a condition for which the user is alone responsible, it has nothing to do with the right application of *the principle as such, nor do the tyre makers recommend it* Sundry examples of the right way to use comfort tyres are available all over the country to-day, merely by observing how small cars of the types mentioned above are presented on the road In these proportionately much larger tyres on such little cars one does not notice that there is any 'flatness" *where the tyre makes contact with the road* Of course, a much better road grip is obtained by the use of a comfort tyre, whether of the beaded edge, the wired-on, or of the straight-sided types, than with ordinary size pneumatics, this being one of the great claims advanced on behalf of the new type Properly to appreciate the matter however, it should be noted that there is not great *length* of contact with the road on the part of the comfort tyre by comparison with an ordinary one rather is it a case of a

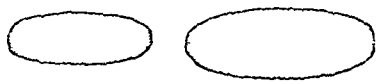

FIG 2—Illustrating relative area of tyre tread contact with the road in the case of a given car fitted with ordinary size pneumatic tyres (the smaller area) and with a low pressure tyre (the larger area) The depth of section represents the direction of travel and the width of section represents the width of grip on the road

greater proportionate area of road grip being obtained (see Fig 2) That makes for safety and efficiency as regards enabling a car to hold the road in circumstance in which, otherwise, it might tend to slip sideways, forwards, or backwards, while the lower pressure gives the suspension system less work to do, so that the car can ride over obstructions, such as stones or bricks, without bouncing *off them* into the air In other words, with the comfort tyre it is *possible, for a given system* of suspension weight, and car speed, to maintain continuous contact with the *road in a* vast variety of circumstances in which an ordinary car would lose contact with the surface, and therefore lose driving efficiency waste petrol, and sustain scraped tyre surface each time the driven wheel came back on to the ground But *the larger area of contact* achieved by the use of the comfort tyre, being particularly appreciable in regard to the width of the road *grip (see Fig 2)*, dictates

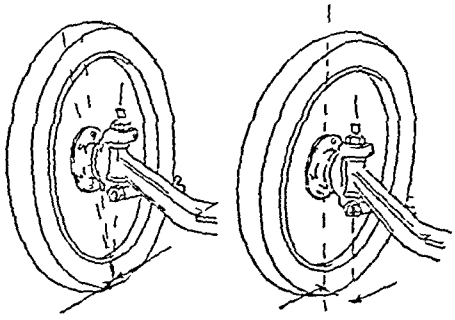

FIG 3—Illustrating (left) true centre point steering and (*right*) non pivotal steering

that the steering must be designed on true centre-point principles unless the driver is to exercise *much effort*, which is undesirable not only as far as he is concerned, but also because it means that the tyre tread is being scraped whenever the course of the car is being deflected *that makes* for wear (*Fig 3*)

"Bogie" Points Banished by Practice

Some imagine that the use of comfort tyres must necessarily take something off the speed of the car They would have a very strong argument if *medical men* had to drive their cars at speeds at which experimental machines are designed to run for records (such as the Darracq performance which set up a fresh standard last week) by which to judge car engine efficiency But at the speeds at which the medical man *requires to drive* his car the difference between the use of comfort and of the ordinary section pneumatic tyre is negligible It is not easy to define the *matter more closely than in that, for this reason among others* road surfaces differ all over the country If you drive on those of the billiard table variety, under the heading of mere maximum speed attainable you would achieve better results with an ordinary tyre inflated to its higher pressure than you would with a comfort tyre, which should be inflated to a lower pressure *But if you chance to go over a* road of bad surface, then at such speeds as an ordinary car is capable of you would rather stand to gain than to lose by using a "comfort" tyre, because the "balloon" tyre would itself absorb by its air cushioning action a vast number of the bumps which are occasioned by passing over the irregularities of the road surface Therefore the driving wheels would maintain practically continuous contact with the road surface, and the horse power developed by the engine would not be wasted, as it is the moment a harder inflated, smaller section, ordinary pneumatic tyre receives a jar from an irregularity of the road surface, or from a loose stone, and therefore starts to bump off the road surface into the air where the power of the engine is spun away instead of being harnessed to useful driving effort

In regard to acceleration, as when starting a car on its journey, the momentary existing of an additional load on the back wheels would have no adverse effect by making a low-pressure tyre present a larger area of surface in contact with the road than does a higher pressure, smaller section tyre We should be mindful not to be governed by theory, but rather by practice, for (as has been observed above) the low pressure tyre is a practical proposition to the extent achieved to-day solely and wholly in defiance of principles on which the pneumatic tyre industry has been working all these years

In the matter of cost, there is no reason why bills should be heavier with the use of low pressure than with high-pressure tyres It is too early to determine whether, in the hands of the ordinary motorist, one actually saves money on the tyre bill by using low pressure tyres There is one reason that offers a material prospect of gain by using balloon tyres The whole fabric, being under lower pressure, is stressed to a vastly less extent, which is very important as regards the strain on the cover, which has to be kept inflated not merely when the car is in use during *actual travelling* along the road, but also all the time it stands in the garage, year in, year out There is, besides, one certain economy of wear and tear to be achieved by the use of "comfort" tyres fitted properly and maintained at the correct pressures in the case of cars possessed of true centre-point steering the shackle bolts of the springs, and the springs themselves, are saved wear to a quite extraordinary degree because they are protected by the low pressure, large section pneumatic from a much greater proportion of jars received when traversing irregularities of road surfaces, and those received are cushioned to a remarkable extent

Some Car Builders' Criticisms

The fact that a large number of motor car manufacturers believe in the use of balloon tyres does not mean necessarily that, in the present stage of development, that type has definitely superseded the ordinary section pneumatic On the *contrary, of the builders* who have standardized "balloon" tyres, a goodly proportion provide relatively defective springing and use the "comfort" tyre to disguise that Formerly small car manufacturers, in particular, were wont to demonstrate their machines with ordinary section tyres inflated at pressures below those recommended by the tyre manufacturers

The difficulties experienced in connexion with the use of "balloon" tyres of various sorts include (*a*) the failure of the side walls, which, however, *constitutes a problem* that has been largely solved through the proportionately

wide rim base required by all makers who have standardized this type of tyre for the current year, as indicated above, (b) side roll occasioned by the use of such tyres, which, as I have shown, has not been overcome yet in the case of larger constructions, (c) harder steering, to which the same remark applies, and (d) greater noise As to the last point, one is in the to-day that, where motorists use steel-studded, non-skid ordinary section tyres, the passage of a tredded tyre of good gripping, anti-skid section is used car creates much greater noise than when the all-rubber I have, however, often observed that the use of the balloon type of tyre on middle size and on large cars does create a degree that is noticeable when taking corners, or noise to a in circumstances in which, with ordinary section curves, tyres on the same types of cars, the passage of the tyre would be quite undetected by the human ear

In general, it this stage one's advice to medical men is that, if a manufacturer standardizes his car in any of the smaller categories with "balloon" tyres, it is advisable to run such a vehicle in that condition once one is satisfied that lightness of steering is not prejudiced As regards fitting cars already owned with balloon tyres, one must have in mind the cost involved in fitting different wheels from those standardized for the use of tyres of normal section Therefore, in most cases, it is scarcely worth doing

There remains the case of the medical man who, because he is a specialist, or has a country practice covering a very large area, needs a really efficient middle size, or an actual big, car because he requires to put it to good speed performance on occasion At the moment, one would suggest that it were better to allow manufacturers to go ahead gaining experience with the use of balloon tyres for these constructions than that the medical man should himself make the experiment For one thing, these more powerful, larger scale cars are usually designed with very excellent springing systems, therefore, with the use of ordinary tyres of ordinary section and ordinary pressures, there arises no question of rough and ready riding Unquestionably, much experience will be obtained with balloon tyres during the next twelve months, alike by the tyre industry, by motor car manufacturers, and by the public Doubtless the average medical man will conclude that the first two can more usefully conduct this work than himself

Dunlop's Distinctive Policy

Such a firm as the Dunlop Rubber Company holds that the whole proposition of the "balloon" tyre has been rushed in America Be that as may be, in the issue it has decided to employ a different rim and tube section from those favoured by most manufacturers With its thirty years' experience of both beaded-edge and wired-on types of tyres, its technical staff were of quite an open mind and discussed its technical requirements, the final decision being that a tyre designed to be run at relatively with manufacturers their technical low pressures should be independent of the inflation pressure for its retention on the rim This theory was tested exhaustively, and it proved completely sound in practice, hence the Dunlop balloon tyre is a wired-on type, and, unlike beaded-edge tyres, which are essentially inflation held, it is retained on the rim by its inextensible wire edges being smaller in circumference than the lips of the given rim In this respect this Dunlop type tyre is identical with the straight sided type of tyre, the adoption of which in this country has been delayed chiefly because of its higher initial cost, albeit the straight-sided type is widely favoured in America In balloon tyre practice this difficulty of initial cost can be obviated, and a tyre constructed on straight-sided principles and offered for the first time at a price no higher than that of the beaded-edge tyre of the same nominal size and capacity Incidentally, the Dunlop balloon tyre is used in conjunction with a rim made in a single piece in which the necessary strength can be provided by a relatively much lighter construction, this achieves a simple means of fitting and detaching the tyre, and allows the valve to come through the side of the rim Of balloon tyres in general it should be observed that the use of the corded type of cover construction, being by far the stronger, is general, and, of course, is to be recommended Satisfactory service can be looked for only by maintaining balloon tyres at the pressures the manufacturers recommend for the given size pneumatic

FRONT WHEEL BRAKES

Of front wheel brakes it may be recorded that there is a vast increase in the number of manufacturers who will be standardizing this accessory, particularly in regard to middle sized cars—for instance, Austin, Rover, and Star No one system of construction is accepted universally Front wheel brakes have been evolved to the practical point, but are still merely in the earlier stages of development There is as much difference between the merits of systems used as there is between the engines of the different cars on the market I regret that I can form no other opinion than that the majority of front wheel braking schemes are being supplied to day solely to meet pleadings of the salesmen who realize that the public has been educated to demand such accessories Thoroughly sound and safe front wheel braking schemes are employed in the minority of cases only When a really safe system is fitted an absolutely new standard of motoring safety is achieved by the introduction of front wheel brakes But when a braking system is not satisfactory, at least to the extent to which it is possible to make one in the light of knowledge acquired to date, then it is safer not to have front wheel brakes If any reader doubts this, let him have in mind the fact that in America insurance rates on cars fitted with front wheel brakes have been put up

Apart from one's instinctive objection to doing so in connexion with a development which is really only in the initial stages, it must be said that the whole problem is vastly too intricate at the moment to lay down any hard and fast rules Suffice it for illustration's sake that the front wheel braking system of the expanding shoe type, wherein six sets of brakes are applicable to a given car, as in Sunbeam practice, provides an absolutely new standard of safety in regard to motoring, whereas in regard to certain other cars that shall be nameless, front wheel brakes are designed of smaller diameter than the rear wheel sets, are fitted at lower shoe pressure where shoes are used—say, 7½ lb front to 30 or 40 lb behind—and the front wheel brakes come into operation at an appreciable interval of time after the brakes on the rear wheels By these and other signs they may be recognized as brakes made by firms who realize just enough to be aware of the fact that they do not understand the subject, therefore they wish to take no chances Of course, so little power could be absorbed by a front wheel brake built on the scheme just mentioned that practically no embarrassment would be caused to the freedom of the steering, or what not, if anything did go wrong with the system, in short, this school of motor constructors simply mesmerizes the car owner into the belief that he has an effective front wheel brake

Some Helpful Points

Again, there are systems of brakes by contracting bands, instead of by expanding shoes, which when operating successfully furnish to the given car more efficient brakes than those particular vehicle types have had hitherto, albeit the degree of efficiency in question is, at the most, no more than the efficiency achieved in a car with ordinarily efficient expanding shoe back wheel brakes and none on the front wheels at all When it is wet, the unprotected exterior band type of front wheel brake is undesirable because dirt, grit, and so forth can get into it and, sometimes, the lining becomes saturated Thus when one applies such brakes in rain one discovers that one slides a hundred yards, or more, while yellow grease is being squeezed out of the linings, and that after that they "bite" suddenly In the circumstances it is difficult to lay down hard and fast rules, but serviceable points to have in mind include the following

(a) If a manufacturer offers front wheel brakes at option, buy his car without such brakes, evidently he himself has not sufficient faith in them to put his whole reputation behind them

(*b*) Where a car builder fits front wheel brakes observe whether he has redesigned his front axle to take the twisting strain involved by their application for whereas the I section front axle is the best possible for achieving lightness in combination with sufficient strength for one that has to deal solely with a rolling wheel nevertheless it is about the worst section possible to resist the twisting strain of brake application hence such constructors as Fiat, Sunbeam Lanchester Daimler, Rover, and so forth use either solid circular or tubular section front axles the only point that is material in this connexion being that such sections should be available from the spring pads outwards to the wheels in that it does not matter what section the axle takes between the two springs

(*c*) Test whether the steering is affected in any way by the use of front wheel brakes uphill, downhill on the flat on the camber at fast speeds, legal limit and traffic crawls

(*d*) Do not be bluffed into the belief that, merely because a car has brakes to all four wheels it is necessarily more efficient in that connexion than one that has them to the two rear wheels only, because the former may have small diameter or low pressure or narrow section or otherwise inefficient brakes on all four wheels whereas the latter may have wide deep diameter really effective brakes to the back wheels only and be, in fact, much more efficiently braked

(*e*) Remember that the fitting of front wheel brakes adds to the weight and complication of the car's mechanism

No Universally Adopted System Yet

My own opinion is that front wheel brakes will be universal practice in a few years But it is nineteen years since I had my first experience of front wheel brakes and I realized then, by exciting 'incidents" experienced on greasy surfaces, how much one has to learn before a front wheel brake can be fitted which will prove safe in all circumstances of use That is the problem It is doubtful if the average owner could adjust satisfactorily most front wheel brake schemes That is not so easy as it looks even though the wing nuts be accessible—as, in some cases, beside the very wheel hubs themselves One adjustment for all four brakes is, of course, the best as in Lanchester, Rover and Sunbeam practice Schemes vary vastly in merit, as do methods of control The entirely mechanically controlled Lanchester method is a splendidly sound arrangement Again the compensating scheme adopted by Vauxhall is as excellently effective as it is simple Servo mechanism, which some firms do not fit is nevertheless a great gain in regard to assisting lightness of control and ensuring safety Some firms, such a Sunbeam and Rover use Servo control for the front wheel brakes only and not for the rear set, which, incidentally, is one means by which they conform with the now twenty year-old law that requires that a car should be capable of being held on either of two independent sets of brakes operating on the rear wheels when the vehicle is at a stand on a hill Where Servo mechanism is applied to all four wheels when the car comes to a stand that system of brakes will not hold it Hence the application of Servo mechanism to the front wheel brakes only by certain manufacturers and designers

Rover's New Programme for Medical Men

Than the Rover Company, no British enterprise has succeeded in providing lower-priced more durable, refined, economical running cars that have proved uncommonly dependable and satisfactory over a period of years In one district in the provinces no fewer than eighty five medical men own the 12-h p type of machine who cannot be induced to buy anything of later design because they are so satisfied with the performance The Rover Company, however is making a radical change in its programme of car design and production for the 1925 season which, tests convince me, will be successful in causing the at present contented medical man who can afford it to become dissatisfied with what Rover he has and acquire one of these new style models Briefly the firm will supersede the well known 12-h p —lately revised at 14-h p —side-valve engined three speed car by a four cylinder overhead valve four-speed nominal 14/45-h p car of approximately the same engine capacity (2,132 c c m), but of extraordinarily different performance, the whole power plant and chassis being the design of Mr P A Poppe, who has been working on it with the Rover Company since Christmas last But he had actually this type of chassis in mind from the time of the armistice He designed and built the original power plant and gearsets for Morris-Oxford cars and is a remarkable mathematician The present aim is to produce a Rover car which itself should be at anything ahead of its time This machine which will be introduced to the public at Olympia on October 17th, will be listed at little more than the price of this years 14 h p side valve engined car, and will scarcely scale more than one hundredweight extra including the weight of the balloon tyres standardized It is a very much more ambitious car, alike as to performance and accommodation, than the type it supersedes, the tax being nevertheless only £14 a year Though the overhead valves are on opposite sides of the cylinders only one overhead camshaft is employed Moreover it is set on one side of the engine, being driven by a vertical shaft from the crankshaft A truly hemispherical combustion chamber is achieved, and the sparking plugs are set vertically in the top of each cylinder, in the dead centre—the most efficient position Pressure lubrication is furnished to every engine bearing The lubrication design marks an innovation in among other things, the quantity of oil carried in the sump—about three gallons—which is schemed specially to cool it The lubricant is circulated by a gear pump at the foot of the vertical shaft which drives the overhead camshaft The oil is forced (*a*) up the vertical shaft into the inlet rocker chamber, across the head into the exhaust rocker chamber, thence back into the sump by way of the steering box, and (*b*) along passages in the crankshaft and crankcase to each big end bearing, to each of the three mainshaft bearings, and, from the big ends, upwards through the hollow connecting rods to the gudgeon pin bearings, whence a spray is directed on to the inner side of the piston crown The clutch and gearbox also receive their supply of lubricant from the engine sump, a constant level being maintained in the gearbox Any overflow finds its way into the clutch chamber where it is picked up by the flywheel and discharged through passages back into the crankcase Should water get into the lubrication system by any chance it is rejected by special filters, and falls to a trap below It will be observed that the steering box, which in ordinary cars is generally neglected, is in this case lubricated positively and automatically Four speeds are provided and an extraordinary degree of quiet running is achieved by the introduction of gearwheels with tooth profiles of a form unlike any I know, a consequence being that one does not hesitate to change speed, so quiet is the running on the indirect drives It is possible for a driver familiar with this car to change gear without withdrawing the clutch—a point mentioned to show the extraordinary ease with which the gears can be changed by one who can judge his engine speed accurately

Notable Points of Original Practice

The unit construction of engine and gearbox has been achieved without the disadvantage of inaccessibility ordinarily involved A more accessible chassis I have not seen yet The controls are on the right hand An uncommon feature is that the gear lever itself is adjustable for position, while the hand brake lever design breaks fresh ground The strength of the frame without involving heaviness, is quite beyond the common Four wheel brakes of no less than 13 in shoe diameter, enclosed completely, are furnished on the Perrot patent principle as regards the control of the front sets Exceptional features of Mr Poppe's design of the braking installation include the means of lubricating the cross-shafts, and the manner of allowing for the difference of axle and spring position when the front wheel brakes are in active operation, equal braking efficiency being transmitted to each of the four wheel brakes during that period only Again, the hand-controlled brakes operate on all four wheels in synchronism, as do the foot-controlled brakes Yet both sets are entirely separate, and each set is so designed that, if the front wheel brakes were to fail, the back ones would hold In effect there are four completely efficient sets of brakes, so that three sets could fail and still the driver would have efficient braking on two wheels of the chassis This interesting device will be one of the notable new things to be studied at the Show The steering gear is adjustable in every direction The steering joint, and the front wheel

brakes control gear joints, are mud- and grit-proof without leather covers The propeller shaft is enclosed, the drive being taken by a clutch consisting of a bronze disc between two steel plates, through the gearbox to a propeller shaft enclosed in a torque tube that has a bearing for the shaft about midway—thus eliminating drumming, which would occur through shaft whip when this length is unsupported—to the back axle driven by silent spiral bevel gear The car does a petrol consumption of about twenty-five miles per gallon at touring speeds, has a wheelbase of 10 feet, a track of 4 feet 6 inches, a ground clearance of 8 inches, and a speed of over a mile a minute, the engine being an uncommonly efficient one, designed for a mean effective pressure of no less than 105 lb per square inch at 2,000 crankshaft revolutions a minute, and capable of acceleration up to 4,000 crankshaft revolutions a minute Therefore, though rated at 14/45 h p, this power plant gives very much more power than the higher figure Yet it can be run for the cost of the now superseded 14-h p Rover car It will be available alike with Weymann and with coach-built bodies

For the medical man the Rover Company will also introduce at Olympia the new 9/20 h p 1,074 c.c. overhead valve water-cooled four-cylinder engined £9 tax type, which is available with two-seat body and with four-seat "chummy" body, also with a three-door body in a *de luxe* edition, all with Dunlop balloon tyres, the petrol consumption varying between forty and fifty miles per gallon The speed possibilities are in excess of fifty miles an hour—I obtained fifty-three miles an hour in test—and the equipment includes an all-weather hood, and so forth, this being a machine that will be marketed at less than £200 in the ordinary version, and a very little more in the *de luxe* version, which latter has 5 inches longer wheelbase Rover is one of the notable 1925 recruits to the overhead valve system These two chassis types, together with the continuation of the 8-h p air-cooled two-cylinder engined machine that sells at £160, complete the firm's manufacturing programme for the 1924-25 season

GLASGOW MEMORIAL TO LORD LISTER

Unveiling Ceremony

So far back as February, 1912, an influential committee was appointed in Glasgow to promote the establishment of a memorial to the immortal memory of Lord Lister Owing to the war the activities of this committee were for a time suspended Later, following various suggestions as to the most suitable form such a memorial might take, it was resolved to erect a statue in bronze to be placed in the Kelvingrove Park A suitable site was obtained near the statue of Lord Kelvin, his illustrious contemporary and colleague in the Senate of Glasgow University To Mr G H Paulin, A R S A, was entrusted the preparation of the statue, which is a striking figure in bronze and is mounted on a granite base Lister is represented seated, with head uncovered, and wearing his academic robes The sculptor has depicted him in a strikingly alert attitude and as he was while still in the full vigour of his professional career

The unveiling ceremony took place on September 17th, in the presence of a large and distinguished company The Lord Provost, Mr Matthew W Montgomery, presided and called upon Sir Hector C Cameron, a former dresser, house-surgeon, and assistant of Lord Lister, to unveil the statue Sir Hector, before unveiling the statue, delivered an oration which we give *in extenso*

Sir Hector Cameron's Address

I esteem it a very high honour indeed to have been invited to unveil the statue commemorative of Lord Lister, beside which we are now assembled I am well aware that I owe this honour to the fact—the accidental fact—that I am the sole survivor of those who served under him as house surgeons in Glasgow and one of the very few still alive who listened to his lectures and witnessed his work in the old College and the old Royal Infirmary in the High Street I formed a still closer connexion with him after my house surgeonship was completed, when he invited me to be his assistant in private practice Above all, it was "he for whose applause I strove, I had such reverence for his blame," and he honoured me with an affectionate friendship to the end of his long life Such considerations make me feel that, however much I could have wished that some eminent man of science had been invited to occupy the place in which I now find myself, I may console myself with the reflection that I shall at least fulfil, however imperfectly, what I may well regard as a pious duty

Mr Joseph Lister became a candidate for the chair of surgery in the University of Glasgow on the death of Professor Lawrie in November, 1859, and his appointment was announced on January 28th, 1860 He was then in his thirty third year He had been resident in Edinburgh for some years previously, where, latterly, he had held the post of assistant surgeon to the Royal Infirmary and was an extra mural lecturer on surgery The appointment to the chair in Glasgow did not at that time carry with it the succession to hospital wards, and for the first fifteen months of his professorship he had no opportunity of illustrating by his practice the theoretical teaching which he communicated to his students in his university classroom. He was, however, appointed surgeon to the Royal Infirmary in August, 1861, and began his work there when the winter session opened

From the time he began his professorial duties he commanded the enthusiastic admiration of his students At the end of his first winter session they adopted the very unusual course of presenting him with an address in which they expressed their high appreciation of the lectures to which they had listened and the valuable instruction which had been communicated to them. It is interesting to recall that the member of the class chosen by his fellows to read and present this address to the professor was J B Russell, afterwards the first whole time medical officer of health of Glasgow, a most able public servant of his city, and a pioneer of world wide reputation in the then nascent science of preventive medicine

The enthusiasm thus excited in the students of his first class was fully maintained in succeeding years I became a member of the class in 1862 One of my fellow students was Friedrich Trendelenburg, a son of a professor of the University of Berlin, who had been a friend of Professor Allen Thomson of Glasgow University from then youthful days Young Trendelenburg had in consequence been sent for two years' study to Glasgow under Professor Allen Thomson, Lister, and William Thomson, afterwards Lord Kelvin In later years he made for himself a great reputation as professor of surgery in the University of Leipzig, and introduced valuable improvements in the practice of certain departments of the surgical art With these improvements his name will always be associated Some years ago, in a letter which I received from him, he observed that, while we all regarded Professor Lister with great respect and admiration, none of us could foresee that he would one day "change surgery from the very bottom" This was a just remark All of us, indeed, felt conscious that we were listening to new and valuable lessons not yet in print, but little realized how great their value was or what unspeakable blessings were to flow from their development in the new future It was not, however, until 1865 that Lister began to develop his antiseptic system of wound treatment

It is not possible on such an occasion as this to explain the details of Lister's method of wound treatment, but in the words of a celebrated French surgeon now deceased, writing in 1902, "it produced in the evolution of our science such a revolution that we ought to judge it as though centuries had passed" "Have we not seen," he asks, "in twenty five years such a progress as centuries never made?" The progress thus made has now largely extended And the principles he taught as the foundation of his system are now universally received and acknowledged by surgeons the whole world over, although in many ways the mode of applying them has become modified He wedded surgery and science in a manner unattempted before, with the effect, as has been well said, that surgery, and especially operative surgery, has been so changed as to become "a safe and soundly based science," instead of being, as it was formerly, "a hazardous lottery," The result has been the saving of human lives in number beyond all calculation

Those achievements, you will believe, were not accomplished without indomitable perseverance, and a marvellous patience in the face of great opposition from the majority of the leaders of his profession, especially in his own country From the very first he was under no illusion in regard to the inevitable and hostile criticism which his doctrines must evoke, especially from those who were prejudiced by a life long familiarity with the older teaching and the former methods of practice

In an interesting letter which I some years ago received from Dr Collins Warren of Boston, a distinguished surgeon of America, he told me of a visit which he had paid to Lister's wards in the Royal Infirmary of Glasgow in the summer of

1869 After graduating at Harvard, he had just finished three years of study at various medical schools in Europe, and had returned to London, on his way back to America before realizing that he had learnt all of up-to-date surgery which could be learned. He attended a meeting one evening of the Pathological Society of London where he heard of a surgeon in Glasgow who claimed to be able to prevent the occurrence of suppuration in wounds, but whose claims were received with much incredulity and no little sneering. He determined at once to spend the last week at his disposal in visiting Glasgow and seeing Lister's practice. He did so, and was immensely impressed by everything he saw. One day, after an interesting discussion on the cases of some of the patients in the wards Lister addressed his students and visitors, who were for the most part young men, in such words as these:

> I do not expect my colleagues and contemporaries to adopt my views and to follow such practice as I desire to found upon them. I look to you the men of the future to do this.

Quite a generation passed indeed before his views were adopted and the guiding principles of his practice modified (no doubt in detail, universally followed, as is now happily the case. His nephew and biographer, Sir Pickman Godlee, refers to another occasion on which he expressed similar sentiments. They were uttered when he was an old man and when his scientific views had been acquiesced in and the practice founded on them imitated in some form all over the world. In November, 1902, he was awarded the Copley Medal by the Royal Society, one of the highest honours which a scientific man can receive. At the anniversary dinner of the society in the evening he returned thanks on behalf of the medallists and ended his speech by saying that he had often thought that if he did deserve any credit at all it was at the time when perfectly convinced of the truth of the principle on which he acted and persuaded also of the enormous importance to mankind of being able to carry out that principle in practice, he worked for years together with exceedingly little encouragement from his professional brethren. There were two great exceptions, however—his father-in-law and his students. His biographer adds, He was thinking, no doubt, of the early Glasgow days, before his fame had spread into foreign countries.

THE LISTER MEMORIAL, GLASGOW.

His father-in-law was the great surgeon Professor Syme of Edinburgh. Lister remarked to me more than once after he had become an old man that, in looking back, he felt it was a fortunate circumstance that at the particular stage of his career which had arrived in 1860 he was called to an independent position in Glasgow. He then became his own master and was free to work out his own ideas. He frequently visited Mr. Syme at Millbank, his residence near Edinburgh, talked to him fully of the work he was doing in Glasgow and received from him from first to last, nothing but the greatest encouragement and approval.

My Lord Provost, I think we ought to feel very grateful to the municipal authorities of this city for having granted us this excellent site. A very little reflection makes me feel how eminently suitable it is. Lister, when he was engaged in thinking out some difficult problem or in composing some important paper, preferred to do this if the season and weather permitted in the open air and preferably during an hour or more before breakfast. For this purpose this park was his favourite resort. Very soon after he settled in Glasgow at 17, Woodside Place, when speaking in a letter to his father of an article which he was writing for publication, he says:

> I find this a very nice place for working at. The Park being an excellent Academia for peripatetic study, and most of what I have written has been composed there and written there in a little pocket-notebook. His favourite walk was under a row of tall elms which ran along just inside the railing in front of Royal Terrace, and sheltered in their branches a colony of rooks, which have long ago disappeared. Then the monument of his colleague Lord Kelvin is only distant from his late place. In your time colleague, when Lister entered the Senate of the University in 1869, and a fast friendship existed between them until the death of Lord Kelvin in 1907. In their later years the two were often fellow-workers together in the Royal Society, and on the demission of the presidency of the society in 1895 by Lord Kelvin he was succeeded by Lord Lister. The site, moreover, is in the immediate vicinity of the modern home of the ancient University upon which both have shed such bright and lasting lustre.

I have heard the remark made frequently of late that we might have commemorated Lister by some better and more useful means than by the statue. His fame as such person, his real monument and it will outlast your bronze. This may be true, but no stone now stands upon another of the old College in the High Street or of the old Infirmary in which he laboured, and surely it is not unfitting that we should raise some visible symbol of expression of our gratitude to one of the greatest benefactors of the human race—expressive too of our pride in the fact that the principles of antiseptic surgery were first discovered, enunciated and carried to a successful practical issue while he still occupied the chair of surgery in our University.

Principal Sir Donald MacAlister proposed a vote of thanks to Sir Hector Cameron in felicitous terms. He said that as a pupil, an assistant, a disciple, a friend, and an able and inspiring interpreter of Lord Lister, none could have been more fittingly chosen to grace the ceremony and none could have explained its significance to them in happier terms than Sir Hector Cameron. He congratulated the sculptor on his successful presentation of the features and bearing of Lord Lister. Finally he expressed thanks to the Memorial Committee and to the executive who collaborated not only in providing this statue for Glasgow, but in contributing substantially to the international fund for the provision of a Lister Prize and Lectureship for the memorial in Westminster Abbey, and for the due display and preservation of the Lister Collection in the Glasgow Royal Infirmary. Professor John H. Teacher on behalf of the committee, asked the Lord Provost to accept the statue as a symbol of their homage to Lord Lister.

Prior to the unveiling ceremony a company was entertained to lunch in the City Chambers by the Lord Provost and members of the Lord Lister Committee. The guests included Mr. J. J. Lister, F.R.S., of Cambridge, a nephew of Lord Lister. The "Undying Memory" of Lord Lister was toasted in silence by the company. The Lord Provost of Edinburgh, Sir William Sleigh, proposed the Glasgow Lord Lister Memorial Committee and in so doing emphasized the happy relations existing between Glasgow, where Lord Lister carried out his great work, and Edinburgh, to which he came on leaving Glasgow. Mr. A. E. Maylard, M.B., B.S., proposed the health of the chairman, and Sir Donald MacAlister gave the toast of the Lister family, with which he coupled the name of Mr. J. J. Lister. The latter, in his reply, gave some very interesting personal reminiscences of his uncle Lord Lister, illustrative of his enthusiasm as a worker and his lovableness as a man.

England and Wales.

SMALL-POX IN ENGLAND AND WALES

THE Ministry of Health has supplied the following statement for publication

At the present time small-pox is prevalent in the county borough of Middlesbrough, the borough of Chesterfield, and the urban district of Hucknall, in all of which districts the disease has continued to be present since the autumn of 1923 Other sanitary districts now mainly affected are the county borough of Derby, the rural district of Chesterfield, the borough of Mansfield, and the urban districts of Mansfield Woodhouse, Ashington, Melton Mowbray, and Gainsborough Within the last four weeks sporadic cases have occurred in twenty-one other sanitary districts, including the metropolitan borough of St Pancras, the county boroughs of Barnsley, Leeds, Leicester, Sheffield, and Oxford On three separate occasions this year a single case of the disease has been notified from different metropolitan boroughs There is no evidence of the presence of small-pox in London at the present time In 1924, up to the end of the second week in September, small-pox has appeared in ninety-one sanitary districts in England and Wales, including four port sanitary districts The total number of cases is approximately 2,750, as compared with 1,840 in the corresponding period of 1923 The county most heavily invaded is Derby, with a total of approximately 1,080 cases in sixteen sanitary districts, the next in point of number is the contiguous county of Nottingham, with 434 cases in ten sanitary districts 386 cases have occurred in Yorkshire (mainly in Middlesbrough), and 306 in Northumberland (mainly in Ashington) Of the Derbyshire cases more than one-half have occurred in the borough and rural district of Chesterfield Although generally the type of disease continues to be mild, severe cases occur from time to time in the Willesden urban district in June and July there were 10 cases with 3 deaths

ORDER OF ST JOHN OF JERUSALEM PRIORY FOR WALES

Sir Herbert D W Lewis, K B E, Commissioner for Wales of the Order of the Hospital of St John of Jerusalem, in his report for the year ending December 31st, 1923, is able to point to a steady progress in the work of the ambulance and nursing divisions in the Principality, which is of happy augury for the future The numerical strength of the brigade is, roughly, 6,000 men and women Ambulance arrangements have been made to cope with accidents at collieries, factories, football matches, race meetings, and all public functions First-aid tents have been pitched at holiday resorts, and very many cases of accidents and disease have received attention during the year In addition to training adults in ambulance and nursing work, the Priory has also inaugurated a scheme for the training of boys and girls, which has been adopted in many Welsh towns and villages The affiliation of the ambulance teaching of the older boys in the Scout movement to the St John Ambulance Brigade has benefited both organizations alike The ambulance department, comprising the teaching of first aid, home nursing, home sanitation, home hygiene, and allied subjects, has issued 7,890 certificates and awards in 1923, as compared with 5,466 in 1922, and 3,207 in 1921 Thirteen medals awarded on the completion of fifteen years' service in the brigade were presented during the year In 1922 the ambulance work of the Great Western Railway was affiliated to the St John Ambulance Brigade, with very successful results, and on January 1st, 1924, the corresponding training in the London, Midland and Scottish Railway was similarly affiliated The motor ambulance transport service, which is the second largest in England and Wales, carried during 1923, 2,294 patients, involving a mileage of over 40,000 Provision is made for every colliery, factory, and householder to have the right to summon an ambulance car at any time of the day or night in return for a small annual subscription The stores department at headquarters has dealt with a large demand for first-aid manuals, appliances, uniforms, and apparatus during the year, and, through the medical comforts depots scheme, any medical requisite may be borrowed at a nominal cost in cases of sickness or accident The Priory for Wales is now represented on the Welsh Committee of the Central Joint Voluntary Aid Detachment Council, and has taken steps to enrol its quota of members throughout the Principality, in accordance with the new scheme for voluntary aid detachments The work at the Swansea Orthopaedic Clinic for Ex-service Men, and at the spa treatment establishment at Llandrindod Wells, has made considerable progress during the year, and large numbers of people have been benefited

A NEW LIVERPOOL HOSPITAL

Realizing the importance of prevention of disease as one of the objectives of modern medical science, to which so much attention was drawn at the recent Congress of the Royal Sanitary Institute, held at Liverpool last July, a movement to found a special hospital for the treatment of diseases of the heart has been initiated At the inaugural meeting Professor Caton, Pro-Chancellor of the University and Emeritus Professor of Physiology, who, while physician to the Royal Infirmary, devoted special attention to these diseases, urged strongly the desirability of establishing such a hospital, since prolonged rest, therapeutic measures, and remedial exercises were essential in many cases of rheumatic fever if valvular heart disease was to be prevented It was pointed out that the general hospitals, with beds limited to cases of acute illness, did not provide for cases of heart disease requiring long-continued rest A special hospital adapted for modern methods of treatment would meet a real want, and a promise of substantial financial aid for the scheme was announced Professor J Martin Beattie supported the movement, and a general committee was formed with Sir James Paton as chairman It is hoped that, with the funds in hand, the new hospital will be opened in two months' time Accommodation for in-patients will be provided to the extent of ten to thirty beds An out-patient department will also be established for those cases that do not require prolonged rest, but rather remedial exercises and appropriate therapeutic treatment

MEDICAL OFFICER OF HEALTH FOR LIVERPOOL

Dr Arthur A Mussen, assistant medical officer of health for the City of Liverpool since 1900, has been selected by a special subcommittee for recommendation to the Health Committee and the City Council for the post of medical officer of health for the city Twenty-nine candidates had sent in applications, and six of these were interviewed The esteem in which Dr Mussen is held by the medical profession in Liverpool called forth the following resolution of the Liverpool Division of the British Medical Association in July last

This meeting of the Liverpool Division of the British Medical Association hearing that Dr A A Mussen is a candidate for the post of medical officer of health of Liverpool, desires to record the fact that during the twenty four years he has been in collaboration with the members of the medical profession in Liverpool on the many problems of infectious disease and public health, he has gained their complete confidence and respect

MANCHESTER ROYAL INFIRMARY

A course of post graduate lectures and demonstrations at Manchester Royal Infirmary commences on September 30th with a lecture by Mr J Howson Ray on carcinoma of the rectum, operable and inoperable On the following Tuesday the Lloyd Roberts lecture will be delivered by Sir John Bland-Sutton, President of the Royal College of Surgeons of England, who will speak on the subject of "Attic salt for gall stones" The post-graduate lectures will be continued on successive Tuesdays until December 16th Short courses of lectures on special subjects explaining recent scientific research work will be given on Fridays, commencing on Friday, October 3rd, when Professor H S Raper will give the first of two lectures on fat metabolism and some of its disorders All these lectures will commence at 4 15 p m , no fee is charged The titles of the succeeding lectures will be found in our Diary columns during the coming weeks The honorary secretary for post-graduate courses is Dr E Bosdin Leech

Ireland.

Appointment of Poor Law Medical Officers (Free State)

For more than a year the management of the Dublin Union has been in the hands of commissioners or vice-guardians who were appointed by the Ministry of Local Government and Public Health when it dissolved the local board of guardians. The commissioners possess all the powers of a board of guardians with regard to the filling of medical vacancies, is significant and has given much satisfaction to the medical profession in Ireland as a step towards a proper system of making medical appointments on merits alone. In connexion with the appointment of four dispensary medical officers for the Dublin Union a letter was read at the last meeting of the commissioners, from the Ministry of Local Government, stating that the Minister considered it would be greatly in the public interests if the commissioners could establish a special Selection Board to appraise the merits, qualifications, and experience of the applicants. The commissioners decided to write to the registrars of the medical schools of University College, Trinity College, and the Conjoint Board of the Royal Colleges of Physicians and Surgeons asking them to appoint a representative each to act as a Selection Board, the chairman of the Dublin County Council to be asked to act as chairman. It is understood that the commissioners are prepared to elect the persons selected by such board to the present vacancies.

Medical Assistance at Operations in Workhouse Hospitals

The Ballymoney board of guardians (County Antrim) recently demanded from Dr. McClelland, medical officer of the workhouse, an explanation of why, instead of summoning medical assistance himself, he did not comply with the regulations and have such assistance provided by the master of the workhouse. In his reply Dr. McClelland stated that he was forced to make the arrangement himself in the interests of the patient, who was suffering from an appendicular abscess. To carry out the regulations would have meant such a delay as to imperil his patient's life. In the circumstances he arranged with the nearest available doctors, and he (Dr. McClelland) had never yet seen a major operation undertaken without the presence of three doctors. One of the guardians stated that the doctor's explanation was not really very satisfactory, and the board decided ultimately to forward Dr. McClelland's letter to the Ministry of Home Affairs (Northern Parliament). At a meeting of the Omagh guardians a letter was read from the Ministry of Home Affairs, stating that the board should pay a fee of £21, claimed by Dr. E. Thompson, F.P.C.S.I., surgeon to the Tyrone County Hospital, for performing a serious surgical operation, provided the patient was properly admitted to the workhouse hospital and that Dr. Thompson was requisitioned in accordance with the workhouse regulations. The guardians decided to pay the fee to Dr. Thompson.

Presentation to Dr. P. Grace Kilkenny

On his promotion to the post of superintendent of the Marvborough Mental Hospital, Queen's County, Dr. Pierce Grace has been presented with a handsome case of cutlery subscribed by the officers and staff of the Kilkenny Mental Hospital, where Dr. Grace has acted for many years as assistant medical officer. Dr. Pierce Grace was for several years a very efficient secretary of the South-Eastern of Ireland Branch of the British Medical Association. The Marvborough Mental Hospital, which serves as the district asylum for King's and Queen's Counties, is an institution of 623 beds and was established ninety years ago.

Correspondence.

HERPES ZOSTER IN HODGKIN'S DISEASE, AND ARSENICAL TREATMENT

SIR,—It was, I believe, Sir Jonathan Hutchinson who first drew attention to the occasional development of herpes zoster in patients undergoing arsenical treatment, and in the epidemic of chronic arsenical poisoning among beer-drinkers in England, in 1900 it was the occurrence of herpes zoster in some of the victims that led F. S. Reynolds to the discovery of the real cause of the symptoms.

I have met with a few cases of Hodgkin's disease (lymphogranulomatosis maligna) in which an attack of herpes zoster constituted a temporary complication, but there were cases which were being treated with arsenic. As far as I can remember I have never seen herpes zoster in patients with Hodgkin disease apart from arsenical therapy.

Recently, however, Professor H. K. Pancoast and Dr. E. P. Pendergrass have written a paper on the occurrence of herpes zoster in Hodgkin's disease[1] in which four cases of the disease complicated with herpes zoster are summarized. Arsenical therapy is so frequently employed as part of the treatment for Hodgkin's disease that as it is not definitely stated that the patients were given no arsenic one is to my mind almost justified in assuming that the herpes zoster in all the four cases was "arsenical" in origin rather than due to the Hodgkin disease itself.

It seems that arsenical therapy sometimes predisposes patients to an attack of herpes zoster, and that an attack of herpes zoster during arsenical therapy, though a warning sign, does not necessarily signify that arsenic is being given in excess. In fact it appears that herpes zoster occurring during treatment with arsenic is to be regarded not as a direct toxic effect but rather as an attack of ordinary herpes zoster to which the arsenic in some unknown way has rendered the patient liable. But here one is on uncertain speculative ground. Does an attack of so-called "arsenical herpes zoster" shield the individual from subsequent attacks of (ordinary) herpes zoster? Has anyone seen herpes zoster in a patient who is known to have suffered previously from "arsenical" herpes zoster? Has anyone seen herpes zoster in Hodgkin's disease when arsenic could be definitely excluded as a factor in the causation?—I am, etc.,

F. PARKES WEBER, M.D., F.R.C.P.

London, W.1, March.

GALL STONES AND CANCER

SIR,—Like Mr. McAdam Eccles I was much interested in Dr. Archibald Leitch's lecture on "Gall stones and cancer of the gall bladder."

I introduced one or more gall stones into the gall bladders of dogs under aseptic conditions. The results were published in this JOURNAL in 1905. The stones disappeared in every instance within two months. The late Vaughan Harley had previously performed similar experiments. He kept the dogs alive for twelve months after each experiment, and at the *post-mortem* examinations the stones had completely vanished. I concluded from my experiments that in dogs the normal bile will dissolve any medium-sized stone. The results in guinea-pigs seem to be entirely different.

My object in writing this note is to suggest that it would be unwise to draw deductions from experiments upon guinea-pigs in relation to the incidence of cancer in cholelithiasis in the human subject.—I am, etc.,

WILLIAM BAIN.

Harrogate, Sept. 21st.

SIR,—Now that Dr. Archibald Leitch's brilliant experiments have demonstrated that cancer can indubitably be caused by simple mechanical irritation, it only remains "to be shown *how* mechanical irritation can produce cancer," and the tale will be told.

The conditions found in one after another of his guinea-pigs reveal very clearly a struggle for existence on the part

[1] *Amer. Journ. Med. Sci.* Philadelphia, 1922, clxiii, 1–26.

of the epithelial cells lining the gall bladder, comparable, surely, to the struggle for existence of any species of unicellular organism faced with a new and menacing addition to its environment The existing generation of cells is beaten down, almost exterminated, but from the depths of the glands new generations of cells arise, push up to the surface, and are destroyed in their turn The qualities that count in this struggle are the capacity for rude growth and rapid reproduction, and by a process of natural selection among the cells these qualities become the distinguishing characteristics of the succeeding generations It is really a process of reversion to type—reversion of the highly specialized tissue cell under the stress of hard times towards the primitive protozoal ancestor of all cells, just as highly specialized plants and domestic animals devolve backwards towards rude ancestral types when removed from their artificial environment and forced to breed wild The tissue cell has an inherent respect for boundaries, and many stages on the road of reversion must be passed before the riotously growing product of the process pierces the limiting membrane of its normal habitat and invades its orderly neighbours These must inevitably yield before the uncivilized hordes, as the Romans before the Gauls, and so the whole picture of cancer develops

All this has been laughed at before as "fanciful" and "pure theory" But obsession with experimental methods should not altogether exclude the philosopher's armchair excogitations The theory fits the facts, and no one has ever been able to show me where the analogy breaks down Its kernel lies in the ability to visualize the cells of the animal body as individuals having, in addition to their own responsibilities, a life of their own, their own infinitesimal variations of structure and quality, and an obedience to the laws of growth and reproduction and the origin of species which we believe to operate throughout the living world —I am, etc,

Ashton under Lyne Sept 15th

TREATMENT OF PUERPERAL SEPSIS

SIR,—We do not see why the staff of Queen Charlotte's Hospital should be surprised that Dr Cuimey should advocate exploration of the uterus in septic cases

We have both had a large obstetric practice extending over many years, and have always carried out this treatment in cases of definite infection of the uterus where the temperature has remained up for over twenty-four hours and have never seen it cause general septicæmia In almost all these cases small pieces of placenta or membranes have been found and removed, and the patients have nearly all of them shown immediate benefit Those cases where septicæmia has developed have been those where exploration has not been carried out early enough owing to a doubt as to whether the trouble was definitely uterine

We quite agree with Dr Cuimey that it is impossible to say without exploration whether the placenta is complete or not, for in many cases of post partum haemorrhage small pieces are found which it is impossible to fit into the recently expressed placenta

It has been our practice at the East End Mothers' Home to explore and douche, with the result that during the last ten years, out of over twenty thousand deliveries, there has not been a death from sepsis, so that in our opinion the danger feared by the staff of Queen Charlotte's Hospital is more than counterbalanced by the good done, and until other hospitals can show statistics which compare favourably with these we think that practitioners would do well to continue the old method, laying stress on Dr Cuimey's advice, "with the greatest care and all possible gentleness"—We are, etc,

M CURSHAM CORNER, M D
W H F OAKEY

London, E1, Sept 16th

SIR,—I was very interested in the letter of the staff of Queen Charlotte's Hospital (September 13th, p 488), and am glad to see that they discourage "meddlesome midwifery" I am all the more interested because I was called in to a case of puerperal septicæmia a few weeks ago The woman was confined on August 5th, and on the morning of August 9th I saw her with a pulse of 140 and a temperature of 104 6° The lochia were very offensive I obtained some antistreptococcus serum (multivalent) of the Lister Institute, and I gave 10 c.cm subcutaneously in the loin that same evening She had one perchloride douche, and afterwards two lysol douches a day for three days, finishing up with one a day for a few days longer The day after the injection of the serum the temperature fell to 99° and the pulse to 86 A slight rise of temperature took place on August 13th, but on August 17th the temperature was normal and continued so The patient made a good recovery

I have been very fortunate not to have had a single case of puerperal septicæmia in about 1,500 midwifery cases whom I was engaged to attend —I am, etc,

PHILIP LAMBERT BENSON, M A, M D

Steeple Claydon Bucks, Sept 16th

SUGAR AND MIGRAINE

SIR,—Migraine has been ascribed to so many causes, and the treatment is so diversified, that it is justifiable to conclude that the etiology is imperfectly understood It is said that attacks usually cease after the age of 50 or 60 I have not noticed that in excess of sugar in the blood has been mentioned as a cause I believe it to be, however, a potent factor in migraine, and that many persons who now regularly suffer from migraine will find the attacks disappear entirely if sugar be eliminated from the diet The drawback to this deprivation of sugar is that these individuals, who have been depending on sugar for much of their nervous and muscular energy, may find that they cannot bear muscular exertion so well, and that the heart's action is not so strong and steady

Experiments appear to warrant the conclusion that the effect of emotional excitement—of stimulation of the sympathetic nervous system—is a call-up of the sugar supplies, shall we say a flooding of sugar into the blood? The issue, then, will be Can this extra amount of sugar be properly dealt with?

The sugar has to be oxidized into carbonic acid and water The exact chemical changes are unknown Professors Bainbridge and Menzies suggest that lactic acid and pyruvic acid are intermediate products Some persons respond readily to emotional stimuli, their sympathetic nervous system is strongly active, and if there be already a surcharge of sugar in the system, the additional mobilization may be such that the chemical changes, including oxidation, are defective, and there may be, as in diabetes, a toxic acidosis May not migraine be a toxic acidosis? To those who are liable to it, I would suggest that they cut down their supplies of sugar, particularly at times of mental stress, and though as a rule, sugar and carbohydrates should be taken sufficiently to produce fuel for muscular energy, fresh air and deep breathing will be necessary to bring about oxidation of the sugar in the blood, and also bodily exercise to work off any sugar excess

One main reason why migraine diminishes in frequency and severity after middle age may be that the individual, having taken to heart the lessons of the past, is more nonchalant, more indifferent to results So many things which previously were emotional stimuli no longer excite, or excite in diminished degree, the sympathetic nervous system —I am, etc,

Devizes, Aug 23rd

MINERAL ELEMENTS OF FOOD IN RELATION TO HEALTH

SIR,—It is to be regretted that Dr John Boyd Orr, in his very instructive paper you report in your columns (September 20th, p 504), does not include in his remedial measures to meet the deficiency of mineral salts in the average diet the use of whole wheat flour as opposed to white flour

It is evident, from the figures in Table I of his paper, that, while white flour is very deficient in mineral salts, whole wheat—and especially the bran constituent—is comparatively rich in these substances and compares favourably in this respect with milk, which in this particular he takes for his standard

Of the importance of training children to eat whole wheat bread there can be no doubt whatever If there be individuals whose digestive powers cannot deal with it —and this is doubtful—they are already the subjects of disease and disorder of the alimentary tract The healthy child can digest it, and no other kind should ever be offered to children Instead of the patent cereal foods whole wheat flour should be used as soon as the child is weaned Later it should be given the crusts of the whole wheat loaf to cut its teeth on, and in the nursery and in the schools the growing boy and girl should see no other loaf, nor be given any opportunity to develop the vitiated taste for white bread —I am, etc ,

London W Sept 22nd. S HENNING BELFRAGE

WHOLEMEAL BREAD

SIR,—About two decades ago a brown bread campaign was brought prominently before us by Sir Prescott Hewitt, and although it was without the scientific information which we possess to-day, yet the profession was in accord with its supporters The difficulty of its preparation was the crux of the serviceableness of this diet to the general public To overcome the roughness of the grain meal by the miller's stones demanded fine trituration The millers were not prepared to supply offhand the coarse, medium, and fine meal, the additional cost was no little consideration The Thanet wheat of Kent was boomed as a fine cereal growth, and I believe Sir Prescott Hewitt advocated the Riverden Mills in Ramsgate as possessing a special plant for the process Bread was prepared from this celebrated Thanet wheat, and it was also put up in the form of shortbread with added milk But it was found to be too heavy and not easily leavened by yeast fermentation. Thus, as a dietetic article it was only sparingly consumed by a few people Crushed cereals under varying proprietary ownership have to some extent replaced wholemeal bread The question has yet to be solved whether the stickiness of these food preparations taken in the form of porridge, is to the best advantage of human dentition Nevertheless we should be in a position to advise our patients what is the best substitute for the present unsatisfactory white loaf —I am, etc ,

Cheltenham, Sept. 15 h. JOHN FRED BRISCOE

PICRIC ACID DERMATITIS

SIR,—Having read with interest Dr Semon's memorandum in last week's issue of the BRITISH MEDICAL JOURNAL (p 520) under the above heading, I wish to endorse all that he says on the subject

In our textbooks which refer at all to this particular drug eruption the description of the rash is dismissed by saying it is like measles or scarlet fever A case which I was asked to see recently presented the following appearances The skin of the limbs at the site of the dressing and near it was inflamed, with here and there a bulla, as though a mustard plaster had been applied and left on too long On the trunk it was blotchy and of a pale pink colour Several of the blotches were slightly oedematous, with well defined margins, not unlike those seen in erythema multiforme Some of these when pressed upon showed a faint purpuric staining —I am, etc ,

ALFRED EDDOWES, M D , M R C P

London W 1 Sept 21st

TREATMENT OF PNEUMONIA IN AN OXYGEN ATMOSPHERE

SIR,—I herewith enclose the record of two experiments made during an attack of pneumonia contracted by two of my chimpanzees I thought it might perhaps interest some of your readers to know the details of the beneficial results obtained by the administration of oxygen in such unusually large doses

Two chimpanzees, used in my laboratory for antituberculosis tests accidentally developed symptoms of acute mucopurulent infection of the air passages accompanied by severe constitutional symptoms Dr Stephani and Dr Trechsel both diagnosed pneumonia This opinion was confirmed by microscopical examination

CASE I

Chimpanzee Alice female 2½ years old

April 5th Cough anorexia lassitude Treatment 6 drops of turpentine twice a day, in milk and half a spoonful of Famel's syrup To stimulate the appetite one drop of arrhenal and one third of a teaspoonful of granulated condurango and kola were given morning and night

April 7th Cough sputum purulent nasal discharge anorexia prostration breathing very fast and short (60 respirations a minute) pulse uncountable Rectal temperature could not be taken as the animal was getting very upset at each attempt to use the thermometer Microscopical examination showed the presence of a very large number of pneumococci with occasional bacilli of Friedlander in sputum and nasal discharge

April 8th Animal much worse extremely weak, 70 respirations a minute condition of collapse, long and violent attacks of cough rales perceptible without the stethoscope Codeine syrup was then given repeatedly also spiritus ammonii anisatus By this time dyspnoea had become very severe and massive doses of oxygen were then administered To obtain the full benefit of the oxygen the animal was placed four times a day (morning, afternoon, evening, night), for three-quarters of an hour each time in a little box just large enough to contain the ape the box was then closed completely and oxygen introduced by means of two pipes, one at the bottom and one at the top while a small ventilating hole was made at the opposite side Thus 400 litres of oxygen were passed through the box each three-quarters of an hour during which time the chimpanzee was breathing pure oxygen her exhalations being constantly driven out by the current of oxygen The improvement was remarkable and very rapid, and is attributed to the massive doses of oxygen, which were continued in gradually decreasing doses for a fortnight while the general treatment (turpentine Famel's syrup arrhenal kola) lasted three weeks

CASE II

Chimpanzee Vera female 3½ years old

April 10th, 1924 Cough, anorexia prostration The animal remained quiet in a corner refusing to move or eat Treatment the same as for previous animal (turpentine Famel's syrup arrhenal condurango codeine, spiritus ammonii anisatus)

April 12th Violent and frequent attacks of cough much sputum, abundant nasal discharge complete anorexia except for some sugar water with a little milk containing the remedies pulse and temperature could not be taken breathing short and of a whistling type 60 respirations a minute not only at times but all day long condition of collapse Large number of pneumococci and a few bacilli of Friedlander in sputum and nasal discharge Massive doses of oxygen were then administered as described above and within forty-eight hours the animal showed such an improvement that it could be considered out of danger although the sputum and nasal discharge containing the above named micro-organisms lasted during several more days

The two chimpanzees made a complete recovery and are now in perfect health In both cases the symptoms of pneumonia seem to have been most rapidly and favourably influenced by means of the large quantities of oxygen given daily The facts—(1) that pneumonia is usually fatal in chimpanzees, (2) that all acute symptoms disappeared before the usual time of a normal crisis, (3) that the improvement was very great and most rapid as soon as the oxygen was administered—seem to indicate that the oxygen *given in massive doses* had a remarkably beneficial effect —I am, etc ,

Institut Bacteriotherapique Carouge Geneve Sept 14th

THE "ERA" CULT

SIR,—A short while ago you had an article on ERA advising those practising it to give it up on the grounds that they did not know what they were doing Were this applied all round the bulk of medical practice would cease forthwith In the practice of ERA work as carried out by some of us, we can make a claim that cannot, I think, be quite paralleled in any other branch of work—that is, we can give a minute test dose or series of test doses to our subject till we hit on the right dosage for our patient The original 10 rate distribution unit has had fitted to it by our consulting electrician, Mr Yeo, an intermediate 10 rate We find that after a short period of vibration the organisms affecting the patient alter, and that to abolish the reflex caused by them we have to use say in the case of streptococcus, a 2 1 rate in place of 2, a week later we have to use 2 2 Other organisms vary but do not appear to require such rapid changes of rate as the streptococcus

The change of rate necessary to abolish the reflex is got by holding an electrode attached to a treatment unit about two feet from the subject Personally I test the reaction with the finger, and consider the reflex abolished only when a silky smoothness takes the place of the gritty feel got when the reflex is present The fact that a change is necessary shows we are affecting the organism we are dealing

with This change may well be due to an attempt on the part of the micro-organism to change into something not affected by the vibrations Past failure to deal with the streptococcus is probably due to its capabilities of change, or possibly may be due to the presence of a number of allied species, all of which have to be dealt with As all organisms I have treated seem to do the same thing, it is more likely that they all undergo a metamorphosis E R A is a progressive business, and every month brings some fresh discovery As now arranged by the advice of our electrician, Mr Yeo, we are getting vibrations which can be heard with an audiphone two feet from the patient's body and felt easily on contact with the patient As far as one can judge from a short experience, these more powerful vibrations produce more rapid effects I am now thinking the whole matter stands or falls by the diagnosis, according to most general practitioners and the public the one matter of importance is results I claim that the results are good, but can be vastly improved by the physician and electrician working together Scarcely a month passes without some improvement in technique being found Fresh wave rates are being worked out for certain organisms which, if present rates represent the trough, the new rates will represent the crest of the wave

As a means of diagnosis Abrams's instruments give opportunities afforded by no other means Without puncture of the skin or other structures it is possible to prove the presence of organisms and their character in any position in the body It is because one can ascertain the cause of various troubles that one can often relieve cases which have baffled a long series of medical men for years To cease investigation and treatment on these lines would be to put back the clock This will not happen in England, we may be slow and conservative, but we hang on I believe I am right in saying that the cure of a certain class of nerve cases is only possible in a reasonable number of months by E R A methods All I need say about diagnosis now is this Since the guide for my treatment of the case is the measured vibration from my oscilloclast, which will abolish the reflex caused by the organism I am treating, it does not matter what the name of the organism is For example, I get a patient who has suffered from headache and nerve symptoms, I find from the spleen and certain positions on the head a large number of units of rate 57, taking the personal rate I find rate from the oscilloclast, 3 abolishes the reflex, and later 3 or its decimals relieves the condition Am I, because there is scientific doubt as to the diagnosis, to cease using the oscilloclast?

While we are relieving pain we are also in a humble way adding to human knowledge E R A work honestly done is not rule-of-thumb but a matter of adjusting rates of vibration and duration of treatment to the needs of each particular case It has infinite possibilities, and deserves the support of the profession

The effects of vibration from organisms are so permanent that they will remain for weeks and months, perhaps years, unless disturbed by magnetic waves When the *Scientific American* observers abstracted blood from the dynamizer and were amused that the operator got the same result whether the specimen was present or not, they had struck an interesting fact unwittingly, but instead of seeking the cause they jeered at the observer I have repeated the experiment while my subject was not looking and find the vibrations remain the same in character To remove these the use of a magnet is necessary My partner, Dr Hessey, pinned a carcinoma blood on the wall for practice in testing, the spot where it had been gave a carcinoma reaction three weeks afterwards While results remain good and there are a world of interesting phenomena to investigate, to drop E R A would be cowardly folly—

I am, etc,

St Leonards on Sea, Aug 15th

MEDICAL OFFICERS AND CONSULTING FEES

SIR,—In the JOURNAL of September 20th appears a short letter from "Tuberculosis Officer" on this subject It is singular that he has not signed his name, and it has been my custom in the past to reply to remarks only from those who so sign, but upon this occasion I will do otherwise

This correspondent appears terribly aggrieved at the recommendation of the Representative Body at Bradford, which he says he reads with amazement—that is, that "whole-time" medical officers should not accept fees for private consultations as he has already done I trust he has had the sanction of his council When these gentle men are worth consulting let them by all means be consulted in the ordinary course of their duties as a whole time official, but "Tuberculosis Officer" appears to regard his fee as the essential part of a consultation, which is a poor ideal

I agree entirely with the recommendation of the Representative Body at the Bradford meeting The profession must be disappointed with the results of this special treatment of tuberculosis

I venture to suggest that those gentlemen who act as tuberculosis officers are, many of them, not well selected Many of them have never even been a house physician, much less one in a chest hospital, and often receive their appointments as a step up the ladder after being an assistant school medical officer Many of them are quite juniors with no previous special training in chest diseases Their salaries are good, and in many cases too high for the work they do in comparison with the work done and hours of duty and income of a general practitioner after he has deducted his expenses, which the tuberculosis officer has found for him

These whole-time medical officers are not necessarily specialists in the sense understood by those who desire expert advice, and it is a title that they have wrongly assumed for themselves, the profession, moreover, as a whole does not recognize them as such, and all their efforts will not reverse the recommendation referred to, as "Tuberculosis Officer" suggests—I am, etc,

ARTHUR M BARFORD

Chichester, Sept 20th

THE GENERAL PRACTITIONER AND PREVENTIVE MEDICINE

SIR,—I wish strongly to deprecate the differentiation attempted by "Whole Time" (September 20th, p 543) between, on the one hand, the tuberculosis, venereal disease, and child welfare officers, who are, or should be, specialists, and on the other the assistant school medical officer, who need only be a junior man or woman Surely the assistant school medical officer is, or should be, a physician with a broad outlook on children and their diseases, and a special leaning towards preventive medicine He should be able to give a reasonably sound opinion on a child's chest and write an intelligent report on his or her mental condition His professional status should be such as to command the confidence of the parents, the teachers, and the general practitioners of his area, to whom he refers certain cases for treatment He can hardly be expected, in addition, to estimate errors of refraction and to enucleate tonsils with proper efficiency Such work is appropriately given to others, whether part time or otherwise

Although I have been qualified nearly ten years, I do not find the inspection of school children, in my area at any rate, either easy or merely routine—I am, etc,

M A, M D, D P H

September 20th

EARTHENWARE OR ENAMEL?

SIR,—Within a few months I have been called upon to attend two young women with buttock wounds, in both cases the wounds were the result of the breaking of a "chamber" when in use During thirty odd years of practice I have had to deal with this accident not a few times, and no doubt my experience in this respect is a common one in the work of most practitioners and hospital house-surgeons

It seems to me that in these days when enamelled ware of all kinds is turned out so elegantly there should be no difficulty in replacing the earthenware utensil now in general use by something which would entirely eliminate the risk of such accidents

In my opinion this is a desirable reform which the women doctors of the country might well advocate, and I believe most lay women would be ready to adopt it—I am, etc,

FRANK C FORD

London, S W 19, Aug 24th

The Services

THE HEALTH OF THE NAVY

The report for 1921 of the Director-General of the Medical Department of the Navy is the first issued since that for 1915 the preparation of the statistical reports for the years 1916-20 inclusive having been cancelled by order.[1] Since there are therefore no figures for any of these years available for comparison with the 1921 figures it has been found necessary for this purpose to make use of the figures for 1909-13. An improvement in the general health of the fleet in 1921 is discernible as compared with the five years period there being a relative decrease of 56·76 per 1,000 in the total number of cases of disease and injury entered on the sick list. For the total force the average per man was 0·52 as compared with 0·64 in 1913 the number of such entries on the different stations being East Indies 1·22 China 0·91 Mediterranean 0·60 North America and West Indies 0·61 Africa 0·61 Home Station 0·56 Irregular List 0·50 and Atlantic Fleet 0·48. Moreover the average loss of service for each individual in 1921 compares favourably with the five years ratio and also with that for 1913. The ratio of final invaliding out of the service was 23·22 per 1,000 as compared with 15·46 in the five years period. The death ratio in 1921 was 3·58 per 1,000 as compared with 3·21 of the total number of deaths (337) injury was the cause in 168 and disease in 229.

A statistical account of the various diseases and injuries reported from the different stations is provided. There was an increase of influenza cases of 17·24 per 1,000 as compared with the five years average but the disease was of a very mild type and the death ratio in 1920 was the same as the average. A relative decrease in incidence occurred in pneumococcal infections of the lungs and rheumatic fever a slight increase in nerve diseases and a fractional increase in tuberculosis. In the case of venereal diseases there was an increase of 3·37 per 1,000 in the incidence ratio as compared with the five years average the highest case ratio (30·04) being given by the China Station and the lowest (21·93) by the Home Station.

DEATHS IN THE SERVICES

Surgeon General William Richard Brown C.I.E. Madras Medical Service (ret.) died at La Soldanelle, Pougerert, Switzerland on September 16th aged 74. He was born on May 23rd 1850 educated at Queen's College Belfast and at the Carmichael School Dublin and graduated as M.D. and M.Ch. in the Queen's University Ireland in 1871. He entered the I.M.S. as assistant surgeon on April 1st 1873 and was promoted to surgeon three years later when the rank of assistant surgeon was abolished. After ten years service in military duty and as a district surgeon he was posted to the Madras Medical College in 1883 a professor of pathology and resident surgeon of the college hospital and spent just twenty years at the college during which time he held successively several chairs ending up as principal and professor of medicine. He was promoted to colonel on May 15th 1903 and reverted to military duty as principal medical officer (what would now be called A.D.M.S.) of the Madras district. Eighteen months later he was elected for the post of surgeon-general Madras and head of the Madras service on October 11th 1904 when he succeeded Surgeon-General Sinclair. He retired on April 1st 1908. He received the C.I.E. on January 1st 1906 and a good service pension on March 25th 1907. His only war service was the Pumpa rebellion of 1879-80.

Colonel George Henry Barefoot C.B. C.M.G. Army Medical Staff (ret.) died suddenly in London on September 13th after playing bridge at the East India United Service Club. He was born a Tripasur South India on December 23rd 1864 educated at University College London and after taking the Scott Exhibition triple qualification in 1885 entered the army as surgeon on July 28th 1886. He was gazetted colonel in the long promotion list of March 1st 1915 and retired on October 7th 1919. He served in the Hazara campaign on the North West frontier of India in 1888 when he was mentioned in dispatches and received the frontier medal with a clasp. As a lieutenant-colonel he held the posts of senior medical officer at Dinapore in Bengal and at St. Lucia in the West Indies and the command of the military hospital at Winchester. During the recent war he served as a D.D.M.S. was thrice mentioned in dispatches—in the *London Gazette* of October 19th 1914 January 1st 1916 and January 4th 1917—and received the C.M.G. in 1915 and the C.B. in 1917.

Lieut.-Colonel John Armstrong P.A.M.C. (ret.) died at Old Charlton Kent on August 31st aged 69. He received his medical education in the school of the Royal College of Surgeons Ireland and took the L.R.C.S.I. in 1875 and the L.K.Q.C.P. in 1876. Entering the army as surgeon on August 5th 1877 he became lieutenant-colonel after twenty years service and retired in July 1903. He served in the South African war from 1899 to 1902 when he was P.M.O. to the 2nd Division Natal Field Force under General Sir Redvers Buller V.C. and was present at the actions of Vaal Kranz and Peters Hill the operations on the Tugela Heights and in the relief of Ladysmith. He received the Queen's and King's medals with three and two clasps respectively.

Major Ferdinand Clarence Smith Madras Medical Service (ret.) died suddenly of heart failure at Watford Herts on August 7th aged 69. He was the son of the Rev. Dr. Francis Smith M.A. M.D. Cantab. of Parkstone Dorset for several years a regular chaplain in Burma. Mary and a brother of Deputy Surgeon-General Clarence Cooper I.M.S. who at the age of 94 has been for the past year the senior officer on the retired list of the Indian Medical Service. Major Smith was educated at University College London and took the M.R.C.S. the L.R.C.P. London and the L.S.A. in 1877 and the F.R.C.S. Edin. and the M.P. and M.S. Durh. in 1883. He entered the I.M.S. as surgeon on March 30th 1878 became surgeon-major after twelve years service and retired on July 1 1899. While in the I.M.S. he held the important posts of surgeon to the Madras General Hospital and of civil surgeon of Tanjore and superintendent of the Prince of Wales medical school at that station. After his retirement he remained in Madras where he had a large practice for twenty years till 1915 when he came to England to offer his services in the war. After serving for two years at base hospitals in France he was appointed in 1917 surgical specialist to the Indian War Hospital at Karachi but was invalided in the following year, suffering from rheumatic fever originally contracted in France which affected his heart and from the effects of which he never fully recovered. After eighteen months severe illness he was able to begin practice at Watford where he was held in great affection by his numerous patients.

Universities and Colleges

UNIVERSITY OF LONDON

UNIVERSITY COLLEGE

On Friday October 3rd at 5.30 p.m. Professor T. Percy Nunn will lecture on the scientific investigation of nature. This lecture is introductory to the new course for the M.Sc. on the principles history, and method of science. Professor Ernest Starling will be in the chair. The lecture is open to the public without fee or ticket.

Obituary

THE LATE MR. BROMFIELD PATERSON.—We are indebted to Mr. J. G. Turner, L.R.C.S., for the following personal appreciation of Mr. W. B. Paterson, formerly dental surgeon to St. Bartholomew's Hospital, London, of whom an obituary notice was published last week.

The death of William Bromfield Paterson comes to me as one of my dearest friends, and I cannot but believe that many others who knew him personally better than I did—and he glad to read even a halting tribute to such—I may write. The many knew him as an eminent professional man; few knew him as a happy, simple, unpretentious, and charming optimist. Such I the character I shall remember as out of a long friendship. I was to be best in London and all was arranged—as could be with the war cloud threatening. We consulted and Willie Paterson's solution of the difficulty was a couple of days' outing to calm our nerves—and two memorable days I spent with Paterson and many parts of the Devonshire coast—the Devonshire roll under hatched with the Devonshire kerb and the Devonshire crawl to approach your fish. One other thing can I say—we caught no fish. But we were happy, and it was characteristic of the man that all around were cheerful through his splendid example of higher things and in England's worth.

DR. MICHAEL WILLIAM KELLY, who died on August 24th, aged 45, was the son of the late Mr. Michael Kelly of Wexford, and was educated at the Catholic Medical School in Dublin. In 1904 he received the diplomas of L.R.C.P.I., L.R.C.S.I., and L.M. After filling the posts of house-surgeon to the Mater Misericordiae Hospital, Dublin, and assistant master of the National Maternity Hospital, Dublin, he also held appointments at the Portrane Asylum, Donabate and the Royal Victoria Hospital Bournemouth. He was appointed, in 1907, medical officer to the Killanne Dispensary District. He took part in the framing of the regulations which established the Irish Board of Health, and was one of the medical representatives on the Board. During the second Dail he was a district court judge, and until some months ago was chairman of the North Wexford Sinn Fein executive. He had been a member of the British Medical Association since commencing practice. He leaves a widow and three children.

DR. GRALL, the Inspector-General of the French Colonial Health Service, who died recently at Nice, spent most of his life in Guiana, New Caledonia, Indo-China, and, during the war, in the Near East. His numerous publications included studies on leprosy, malaria and yellow fever; he collaborated also in the production of a treatise on tropical pathology.

OPENING OF THE WINTER SESSION

LONDON MEDICAL SCHOOLS

THE following arrangements have been announced in connexion with the opening of the new winter session at the various medical schools in London

The St Bartholomew's old students' dinner will be held on Wednesday, October 1st, in the Great Hall of the Hospital at 7 for 7 30 p m , with Dr J H Drysdale in the chair

The prizes to students at Charing Cross Hospital Medical School will be distributed on Wednesday, October 1st, at 3 30 p m , by Sir Humphry Rolleston, Bt , President of the Royal College of Physicians of London The annual dinner of past and present students will be held on the evening of the same day at Gatti's Restaurant, when the chair will be taken at 7 30 by Mr Charles Gibbs, senior surgeon to the hospital

The prizes at St George's Hospital Medical School will be distributed on Wednesday, October 1st, at 3 p m , by Sir Isambard Owen, M D , who will also preside at the annual school dinner at the Hotel Metropole on the same evening

At the opening of the new session at King's College Hospital Medical School, Denmark Hill, on Wednesday, October 1st, at 2 30 p m , the introductory address will be delivered by Sir David Ferrier, M D , F R S , Emeritus Professor of Neuropathology and Fellow of King's College The chairman of the hospital, Viscount Hambleden, will preside

The annual old students' dinner of the London Hospital Medical College will be held on Wednesday, October 1st, at the Trocadero Restaurant, under the chairmanship of Professor William Bulloch, F R S

The annual dinner of past and present students of St Mary's Hospital Medical School will be held at the Connaught Rooms, Great Queen Street, W C , on Monday, October 6th, when Dr E M Callender, C B E , will take the chair at 7 30 p m

The winter session of the Middlesex Hospital Medical School will open on Wednesday, October 1st, Dr Charles Porter will deliver an introductory address at 3 p m at the Queen's Hall on some aspects of preventive medicine, and the prizes will be distributed by Lord Birkenhead The annual dinner will be held the same evening at 7 30 at the Hotel Cecil, when Mr G Gordon Taylor will preside

The annual dinner of past and present students of St Thomas's Hospital will be held on Friday October 24th, at Prince's Restaurant, Piccadilly, W , under the chairmanship of Dr Seymour Taylor

Owing to the sudden death of Dr Sidney Martin, senior physician to University College Hospital, the dinner of the past and present students which was to have been held at the Hotel Cecil on October 3rd has been postponed to some date to be arranged in December

At the University of London, University College, on September 29th and 30th from 10 a m to 1 p m , first year students of the Faculty of Medical Sciences will be received by the Provost, the Dean of the Faculty, and the Subdean On September 29th, from 2 15 to 4 p m , students of the Faculty of Medical Sciences other than first year will be received, on the same day at 3 15 p m candidates for the Diploma of Public Health will be received by Professor Kenwood The new buildings for anatomy, anthropology, embryology, histology, and physiology, provided from the gift of the Rockefeller Foundation, are now completely equipped

At the Westminster Hospital Medical School the new session will begin on Thursday, October 2nd, and the inaugural address will be delivered in the board room of the hospital at 3 p m by Mr H J Waring, on 'The medical man of the future'

At the opening of the eighty third session of the Pharmaceutical Society of Great Britain the President, Mr F Pilkington Sargeant, will deliver the inaugural sessional address and present the Perera medal on Wednesday, October 1st, at 3 p m

NEWCASTLE

In connexion with the opening of the winter session 1924 25 at the University of Durham College of Medicine, Newcastle upon Tyne, an introductory address will be given by Sir Thomas J Horder, Bt , M D , physician to St Bartholomew's Hospital, in the Examination Hall of the College, on Monday, October 6th, at 4 p m

Medical News.

THE Royal Society of Medicine will hold its first social evening of the session at 1, Wimpole Street, London, W 1, on Thursday, October 16th, at 8 30, when Fellows and guests will be received by the new President, Sir StClair Thomson At 9 30 p m Dr Grenfell of Labrador will give a brief discourse on "Medicine in a corner of the Empire," with lantern illustrations

THE annual dinner of the Chelsea Clinical Society will be held at the Cafe Royal, Regent Street, W , on Tuesday, October 21st, at 7 for 7 30 p m

THE second week of the course in general medicine and surgery at the Westminster Hospital begins on Monday next, September 29th , entries can still be accepted On the 30th a four weeks' course of lecture demonstrations will be started at the Bethlem Royal Hospital The lectures are given on Tuesdays and Saturdays at 11 a m by Dr Porter Phillips and Dr Thomas Beaton, and the fee for the course is one guinea Commencing on October 6th, a course on tropical medicine at the London School of Hygiene and Tropical Medicine comprises a series of eight clinical demonstrations, and extends over four consecutive weeks A series of four lecture demonstrations on treatment by electro therapy will be given by Dr C B Heald at the Royal Free Hospital, beginning on October 7th Syllabuses of all these courses may be obtained from the Secretary of the Fellowship of Medicine, 1, Wimpole Street, W 1

A COURSE of instruction for health visitors and child welfare workers commences at the Royal Sanitary Institute, Buckingham Palace Road, London S W , on September 29th, as a preparation for the health visitors' examination of the Institute The subjects to be dealt with include vital statistics, health legislation, duties of health visitors, ante natal and infant hygiene, house sanitation, and home visiting In connexion with the course visits will be paid to welfare centres, clinics, and schools for mothers A course of practical training for meat and food inspectors will be held at the Institute from October 3rd onwards

AT a meeting of the Medical Officers of Schools Association to be held on Wednesday afternoon, October 8th, at 11, Chandos Street, Cavendish Square, W 1, Dr Robert Hutchison will open a discussion on the relative values of stone milled and other flours and breads in relation to the nutrition of the growing child There will be an illustrative exhibit of stone milled flours, breads, and other wheaten foods, etc Tea will be served at 4 30, and the discussion will continue from 5 to 7 o'clock

THE thirteenth annual general meeting of the British Commercial Gas Association will be held at Liverpool on Monday, Tuesday, and Wednesday of next week The programme includes a lecture by Dr C W Saleeby on "Light and Life," and an address by the Bishop of Liverpool on "The Worker and his Work"

AN epidemic of bacillary dysentery has recently broken out in Pomerania

THE Ministry of Health announces that the statements in a recent issue of the *Daily Express* as to the stamping out of tuberculosis within the next ten years, and as to the Spahlinger treatment for tuberculosis, are incorrect and unauthorized The most recent official statements as to the decline in tuberculosis and the Spahlinger treatment are contained in the Annual Report of the Ministry for 1923-24 and the Report of the Chief Medical Officer for 1923

THE second number of the *Junior Red Cross Journal*, just published by the British Red Cross Society, contains an account of the work and methods of the Junior Red Cross in health education A description is given of the Star and Garter Home for Disabled Sailors and Soldiers at Richmond and the special work performed by the Red Cross in connexion with the Scout Jamboree at Wembley The number is well illustrated and should interest, as well as instruct, the children to whom it is addressed

DR F J WALDO, at the Southwark coroner's court, on September 19th, referred to the new regulation of the London County Council disallowing fees to medical officers of Poor Law institutions for making necropsies In his other jurisdiction in the City of London he still continues to pay the Poor Law and prison medical officers their statutory fee of 1 guinea for performing a necropsy, and 1 guinea for giving evidence when called upon by himself as City coroner Dr Waldo said he had always been in favour of a fee of 2 guineas being paid for a complete *post mortem* examination performed on a coroner's order, as was the practice in Australia, together with a fee of 1 guinea a day for giving evidence, this being payable to all registered medical practitioners without distinction

THE sixteenth report of the Norwood Sanatorium for the Treatment of Alcoholism and other Drug Habits (The Mansion, Beckenham Park, Kent) covers the three years 1921, 1922, and 1923. During the first of these years 201 patients were admitted, and during each of the second and third 214 patients. The report includes clinical notes by the medical superintendent, Dr Francis Hare, and an account of the treatment adopted.

THE Tokyo death rate has increased 100 per cent., as compared with the period before the earthquake last year. This is largely due to the prevalence of infectious diseases, including typhoid fever. It is officially reported, however, that contagious diseases are rare among those living in improvised dwellings owing to the precautionary measures in force. On July 10th a medical examination was made of 22 284 persons out of the 43 774 so accommodated with the result that no case of infection was detected, there being brought to light only three cases of sunstroke, seventeen of influenza, and sixty four of intestinal catarrh.

DR M JEAN CAMUS professor of physiology at the Paris Medical School, has been elected a member of the French Academy of Medicine.

THE following congresses of Italian societies have been arranged. The thirteenth Congress of Stomatology will be held at Naples from October 13th to 17th, when the following subjects will be discussed: rearrangement of odontological studies, introduced by Professor V. Beretta of Bologna; pathogenesis of dental caries, introduced by Professor G. Mamcardi of Modena; odonto-facial neuralgia introduced by Dr G. Grandi of Trieste. The Congress of Pediatrics will be held at Milan from October 22nd to 25th, when C. Pestalozza and C. Doria will introduce the subject of the determination of the food ration in the child; G. Berghinz the subject of diathesis and constitution in infancy; whilst "parascholastic" institutions and their hygienic and social importance will be discussed by M. Raspi. The Congress of Surgery will meet at Milan from October 26th to 28th: a discussion on sympathectomy will be introduced by G. Uffreduzzi and another on indications for operation in splenomegaly by F. Micheli and Cappelli. The Congress of Internal Medicine will follow the Congress of Surgery at Milan from October 28th to 31st, and deal with the following subjects: suprarenal syndromes, introduced by M. Pende and C. Piazza, and progress in the diagnosis of nephritis introduced by L. Ferranini: the members will unite with those of the Congress of Surgery in the discussion of operation in splenomegaly. The Italian Society of Urology will hold its annual meeting at Milan on October 28th, when G. Lasio will speak on diverticula of the bladder, and C. Bruni and S. Colombino will discuss fulguration of the vesical mucosa. The twenty first congress of the Italian Society of Dermatology and Syphiligraphy will be held at Padua in the second fortnight of December, when the subjects to be discussed will be experimental cutaneous cancer, introduced by Professor E. Bizzozero of Turin, and the cure of syphilis, introduced by Professor L. Tommasi of Florence.

THE eleventh French Congress of Hygiene will be held in Paris from October 20th to 24th, when the following papers will be read: Instruction in hygiene in France by MM. Dequidt and Rochaix: preliminary report on instruction in hygiene abroad, by M. Léon Bernard, instruction in hygiene in secondary schools, by M. Pacaut and Mlle T. Robert, instruction in hygiene in technical institutes, by M. Iras, experimental hygiene and laboratory research, by M. Dujarric de la Rivière, general hygiene and social hygiene, by M. Briau, cleansing of used water, by M. Dienert, role of sunlight in the growth of the child and the physiological equilibrium of the adult, by M. Armand Delille. Admission to the congress is free. Further information can be obtained from M. Bossus, 142, Boulevard Montparnasse, Paris.

THE third International Congress of Military Medicine and Pharmacy will be held in Paris from April 20th to 25th, 1925. An executive committee has been formed, consisting of Inspector General Vincent as president, Drs. Achard, Dopter, Faure, Hartmann, Lejars, Nobecourt, Teissier, and others.

THE tenth French Congress of Legal Medicine will be held at Lille from May 18th to 20th, 1925, under the presidency of Dr J. Leclercq of Lille, when the following subjects will be discussed: (1) Death from "inhibition," introduced by Dr Duvoir of Paris. (2) Trauma and malignant growths, introduced by Drs. Cordonnier and Mullen of Lille. (3) The criminality of persons with skull wounds, introduced by Dr Porot of Algiers.

THE French Society of Ophthalmology at the invitation of the corresponding Belgian Society, will hold its thirty eighth congress in Brussels next year, commencing on May 11th.

A BUST of the celebrated sixteenth century physiologist, Santorio Santorio, was recently unveiled at Capodistria at the termination of the Italian Congress of Hydrology.

QUERIES AND ANSWERS.

"A P" (Pretoria) desires to find a paper by Hutchinson which deals with the aspects of colonies of bacilli as seen in micro copic sections. Schubert (*Centralbl f. Bakt.* Originale 1920) refers to it but omits to say where it was published. Efforts to trace the paper in South Africa have proved fruitless. A letter addressed to Dr Schubert has not been answered.

TREATMENT OF ALOPECIA.

"MEDICO" asks for suggestions for the treatment of a case of alopecia (non syphilitic) in a patient who so far has resisted the usual washing with Hebra's soap spirit and ordinary hair tonics.

CONSTRUCTION AND EQUIPMENT OF ANTE NATAL, TUBERCULOSIS, AND OTHER CENTRES.

"SANITAS" would like to know of a book dealing specially with the public health services in relation to ante natal work, maternity centres, tuberculosis and venereal disease dispensaries and treating of the size, equipment, etc. of such centres for rural and urban areas, small towns and large cities.

*** We have made inquiries but have failed to hear of any work of the kind.

INCOME TAX.

"W J D" has a practice in Malaya but is residing temporarily in this country. He receives monthly remittances of the profits of his practice after payment of the fees of his locumtenent. How should the income be assessed?

* Our correspondent should consider the facts of the case and decide whether he is in fact still conducting the practice through his locumtenent or whether he has for the time being given up control of the practice. In the former case he would be able to claim the earned relief but might be held liable to account for tax on the net unremitted profits (if any) in the latter case he could return the income as derived from a "foreign possession" liable on the basis of the actual sums remitted. On that footing his liability works out as follows for 1924–25:

Income from practice in Malaya		£3 0	
Income from investments in Malaya		£270	
			£6 0
Deduct—Personal allowance (married)		£72 5	
Children allowance (2)		£0 3	
			£33
Income liable to tax			£42
Of which £225 is chargeable at 2s. 6d.		£25 6 3	
£117 4s. 6d.		£25 6 6	
			£51 12 9

No deductions are due in respect of the purchase of the car in this country or the expense of attending post graduate classes, such expenditure is in the nature of capital outlay and in any case is not incurred in the earning of the income now received from Malaya.

"D G C" inquires whether he is liable to pay local rates in respect of a house which has been standing empty but for which he has been paying rent.

*** If the house was empty—that is not containing furniture—there was no beneficial occupation and the rates are not legally enforceable.

LETTERS, NOTES, ETC

HERPES AND VARICELLA

DR FREDERICK MACSORLEY (Belfast) writes The following case, which recently came under my notice, serves to prove that a casual connexion exists between herpes zoster and varicella A girl, aged 5, developed chicken pox She lived in the down stairs portion of a house with her father and mother The upper portion of the house was inhabited by a man and his wife About twelve days after the rash appeared in the child a herpetic eruption developed in the father, in the right fourth to seventh intercostal spaces Simultaneously, the woman in the flat above developed well marked herpes zoster supraorbitalis Mere coincidence does not explain satisfactorily the occurrence of two cases of herpes in a house where varicella exists

DERMATITIS DUE TO HAIRY CATERPILLAR

DR C B ROSSITER (London, E C) writes Surgeon Commander Cock's note in your issue of September 20th (p 550) with reference to my observation on caterpillar dermatitis is very interesting I merely desired to record the peculiar fact that the insect seems to be able to expel its fine hairs like porcupine quills or arrows, and it now appears that these are analogous to poisoned arrows Still it is curious that while each hair sticking in the epidermis is surrounded by a ring of hyperaemia the intervening spaces, unless altered by scratching, are clear and normal, whereas if the irritant produces its effects by mere contact or smearing, as suggested by Fabre, one would expect the hyperaemic areas to be patchy or continuous—for example, as they would be, say, if painted with acetum cantharidis Those familiar with the prickly pear know that if an attempt is made to pluck the fruit with the naked hand one is rewarded with a shower of fine hairs which shoot out of the fruit and stick into the fingers, etc , setting up most intense irritation Possibly these hairs are also covered with some chemical irritant, but it seems hardly necessary to assume that more than the mere penetration of the hair into the epidermis is required to produce what in my opinion is a very analogous condition Another instance I might quote is the irritant effect of cowhage [the stinging hairs of *Mucuna pruriens*] in its usual dry commercial condition A little scattered and lightly rubbed on the hand produces an almost identical effect to the above, and if a lens is used the hairs can be seen sticking out erect from the epidermis, each with its hyperaemic ring A curious fact also is that while these caterpillars are covered with both very long and very short hairs it is only the short variety which is seen on the skin, and these hairs would be sheltered by the long ones from the irritant "droppings" Possibly an explanation is that only caterpillars that "dwell in nests" have the power of expelling their hairs, but here my knowledge of entomology fails me

POISONING BY MUSHROOMS

DR J S PEARSE (Plymouth) writes Dr W B Winckworth's note of cases of poisoning by mushrooms (September 13th, p 493) is of interest As he suggests, a possible explanation of the poisoning may be in the cooking One fact that should be kept in mind is that mushrooms should never be cooked twice If they form part of a stew, and the stew be left to cool and then reheated, the mushrooms are liable to become poisonous To take whisky, brandy, or gin with mushrooms is dangerous, and asking for trouble Having eaten the stalks as well as the tops of many a mushroom without any ill effects, I am sceptical as to any poison being contained in the stalk Of course, if any extraneous matter adheres to the stalk one can well believe some ill effects may arise from the eating of it It is therefore advisable to cut off the end of the stalk and to peel the top Mushrooms are a valuable food, containing, as they do, some 3½ to 4 per cent of protein

PAPILLOMATA OF THE LARYNX OF CHILDREN

DR CHARLES J HILL AITKEN (Kilnhurst, near Rotherham) writes In his book, *Diseases of the Nose and Throat*, Mr Tilley tells of three children who, because of their symptoms, were diagnosed as suffering from diphtheria with laryngeal obstruction and treated accordingly, later the correct diagnosis of papillomata was made Fortunately I had read this, otherwise I might have been misled when I was called to a child, aged 4 years, with marked laryngeal obstruction I advised tracheotomy, which was performed, and a few weeks later papillomata were removed from the larynx This attack of dyspnoea was the worst the child had suffered I was lucky to have seen the patient in the attack, as others had attended the child on previous occasions, but the parents had decided that, as the croupy cough complained of disappeared under treatment with a simple cough mixture, they did not need to take the child to see the doctors again

ACUTE PUERPERAL INVERSION OF THE UTERUS

DR J R C STEPHENS (M O West African Medical Staff, Ilorin, Northern Nigeria) writes that he was interested to read in the BRITISH MEDICAL JOURNAL of July 12th, which arrived by the last mail, the notes on inversion of the uterus (p 88) He sends the following record of a case he saw recently "Early one morning I was asked to see a native woman, but did not know what troubled her I went to her house and found her on the mud floor (all women are delivered here in the sitting position) with a fine female child, the placenta being on the ground but not separated The woman herself was sitting in a pool of blood, faeces, and urine, the fundus of the inverted uterus nearly touching the ground She was quite cheerful, with good pulse, and complained of being hungry I took a pad of cotton wool and gently replaced the uterus, and left her to be cleaned I had no conveniences for any treatment at the time I saw her again in the afternoon, and she was perfectly well, two days later she walked to my out-patient department with the babe on her back Since then she has made no further appearance at the hospital, and I often see her carrying the child, which is doing well"

NEOLITHIC MAN IN MALTA

DR T ZAMMIT, C M G , Rector of the University of Malta and Dr Charles Singer have contributed a joint paper to the *Journal of the Royal Anthropological Institute* (vol liv) on neolithic representations of the human form from the islands of Malta and Gozo The figures were found in what were no doubt temples usually built in pairs In the instance of which a diagram is given one of the pair is much larger than the other The figures are of both sexes, but their peculiarities are most striking in those representing women They have enormous buttocks, fat bellies, and pendulous breasts, but small hands, feet, and heads The artist must have possessed considerable skill, for some of the faces are so specialized that, as the authors say, they were almost certainly portraits In showing figures of extreme fatness the artist would seem to have been working in compliance with some convention, probably religious, which, as is suggested, may have had something to do with fertility, the fat images being conducive to fat crops, but the result, especially the back view, is distinctly comical The portrait models are probably of an offertory character The date of the temples and statues does not appear to be known, but they seem to have been erected before metal reached the islands

A HOUSE OF REST

DR D W SAMWAYS (Knowle, Clyst St George, Devon) writes, There is in Mentone a "house of rest" provided for professional men with restricted means who are temporarily in need of rest or change An inclusive charge of 30s weekly is made The home opens on November 1st It may, on occasion, be useful to members of the profession or to some of their patients Particulars can be obtained by writing to the Matron (Miss Goldie), House of Rest, Quartier Carnoles, Menton, Alpes Maritimes, France Dr Stanley Rendall and I act as honorary physicians

A JENNER RELIC

DR C HOWARD JACKMAN (Heworth Green, York) writes In the BRITISH MEDICAL JOURNAL of September 20th it is stated that Mr G A Turner of Worcester has the horns of the first cow from which the late Dr Jenner procured his vaccine lymph owing to an inscription written on them by his great-nephew, which proves nothing I maintain that the horns of the first cow are in my possession, they were given by the late Dr Jenner to my great grandmother, Mrs Crome, whose children he vaccinated

NIGHT ASSISTANCE FOR MOTORISTS

THE Automobile Association informs us that it has a number of road service outfits patrolling roads widely used by motorists after dark With the arrival of "winter time," the A A patrols doing day duty on cycles, motor cycles, and road service outfits are now on the roads from 9 a m until lighting up time—that is, one hour after sunset The night road service outfits and A A roadside fuel stations work from lighting up time to midnight, so that, in many cases, the A A road organization works continuously from 9 a m until 12 midnight This A A night service, instituted at Easter, is greatly appreciated by members In addition to carrying "spares" and an equipment of light tools, the A A patrols in charge of these outfits procure assistance, or tyres, etc , from garages, when breakdowns are of a serious nature

IN view of the number of unbranded motor spirits at present selling as No 1 without any guarantee as to quality, the British Petroleum Company, Ltd , has decided to drop the numerical designations in connexion with its three grades of petrol, and these in future will be known as "'BP' Aviation," "BP" (for cars and motor cycles), and "'BP' Commercial" for heavy vehicle use

A WARNING

THE individual referred to by Dr W G Niall of Chatham (August 23rd p 348) and by Dr Arthur Lee of Bournemouth (September 13th, p 494) seems recently to have been visiting the neighbourhood of Birmingham and Leamington

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 34, 35, 38, and 39 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 36 and 37

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page *134*

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

220 Insulin in Slight Pancreatic Insufficiency

W REDISCH (*Klin Woch*, August 12th, 1924, p 1478) discusses the question whether the milder forms of pancreatic insufficiency should be treated with insulin There are two objections to the use of insulin its high price and its danger The author maintains that the danger is less in mild cases because smaller doses of insulin are usually required and such doses in non diabetic individuals cause no bad effects He thinks that the administration of the deficient hormones may stimulate the existing islet tissue of the pancreas to increased activity Six cases of mild diabetes are recorded in which insulin treatment was given The blood sugar diminished, and in all cases an increased food tolerance was obtained which enabled the patient to be placed on a diet corresponding in calories to the needs of the body, whilst the urine remained free from sugar and ketone bodies The increased tolerance continued in undiminished degree for three months after the insulin treatment had been discontinued The blood sugar also remained at the low level reached during the insulin treatment The author believes that these results indicate the restoration of the function of the pancreas

221 Treatment of Chronic Ulcerative Colitis

B B CROHN and H ROSENBERG (*Journ Amer Med Assoc*, August 2nd, 1924, p 236) discuss the medical treatment of chronic ulcerative colitis based on their observation of twenty nine cases during the last three years They find rest in bed essential in all acute forms of the disease, and in all chronic cases in which there is recrudescence of symptoms They obtained no success from restricting the diet, and see no disadvantage in a general and rather full diet provided that fruits and vegetables with high cellulose contents are removed The application of heat in the form of hot packs or baking by means of electric light appliances over the colon gives some symptomatic relief Large doses of bismuth subcarbonate gave relief from the diarrhoea, but they prefer for this purpose opium in small doses by the mouth or by suppository Local treatment of the colon is strongly recommended, and silver salts, potassium permanganate zinc sulphate, and iodine have all been found useful During the last two years, however, they have been using an aqueous solution of neutral acriflavine with most satisfactory results They start with a dilution of 1 in 4,000 aqueous or saline solution, and they find that the best results are obtained by beginning with an enema of 20 to 30 oz of the solution twice a day, the enema being retained each time for ten to twenty minutes The symptoms usually abate within the first or second week, the authors then reduce the treatment to once daily, increasing the strength of the solution to 1 in 3 500, and a few days later to 1 in 3,000, which is found to be the greatest strength required The treatment is continued until the temperature is normal and the diarrhoea has ceased They administer the acriflavine subsequently on alternate days using a 0 5 per cent solution of sodium bicarbonate on the intervening days to intensify the antiseptic action of the acriflavine

222 Disturbance of Cystin Metabolism in Children

G O E LIGNAC (*Nederl Tydschr v Geneesk* June 28th, 1924, p 2987) who records two personal cases in children aged 3 and 2 years respectively, has found only one similar case of disturbance of cystin metabolism reported by Kaufmann in a child of 21 months, and in all three extensive deposits of cystin were found in the organs after death, cystin crystals being present in the lungs, spleen, liver, kidneys, mesenteric glands and choroid plexus Control examination of the organs of nine children who had died of various diseases did not reveal any trace of cystin The most striking features in the three cases were the defective physical development, which in Lignac's two patients had been present since birth, and was in contrast with their completely normal mental development The first of his two patients showed considerable improvement of the general condition under treatment by insulin, although the weight remained the same the insulin having apparently no effect on the cystin All three children died of progressive atrophy which in one case was accompanied by disturbance of the carbohydrate metabolism, and in the other by signs of severe infection such as pyelitis, nephritis, and otitis media

223. Autogenous Coli Vaccines in Mucous Colitis

S WENT (*Deut med Woch* May 16th 1924 p 632) contrasts the pessimism usually shown concerning the prognosis for mucous colitis with his own optimism, which is the outcome of treating nine cases with vaccines made from cultures of coliform bacilli cultivated from the stools In every case complete recovery was effected, although the duration of treatment was only about a week In five of the nine cases streptococci were also found in the stools, but as they were not pathogenic to certain animals, and as they could still be found after complete recovery had been effected not disappearing entirely till several days, or even weeks, later, it is doubtful if these germs—Gunther's bacteria—play any important part in the disease The vaccine given by the author was prepared from a two days old culture killed at a temperature of 56°, a suspension in saline solution being made, of which 0 5 c cm was injected subcutaneously on the first occasion Two days later 1 c cm and after another two days 2 c cm were injected The symptoms disappeared completely after the second injection, but the reaction was very severe From four to five hours after the second injection there was a rise of temperature to 102° F and even to 104°, the fever being accompanied by headache and loss of appetite, and the site of the injection becoming hyperaemic, oedematous and painful Rigors were also common and it was not till two or three days after the third injection that the patients recovered from this violent reaction

224. Treatment of Myeloid Leukaemia with Thorium X

E J FEILCHENFELD and A PETERS (*Klin Woch*, August 5th, 1924, p 1449) record a case of myeloid leukaemia in which the symptoms and blood changes disappeared under treatment with thorium *x* The case must be regarded as either an instance of the curative action of thorium *x*, or a very remarkable coincidence of a spontaneous remission of the disease with a course of treatment The patient, a woman aged 30, had well marked myeloid leukaemia and was under observation for nine months The spleen extended down to the iliac crest, and the blood changes were typical After a short course of treatment with arsenic without result, thorium *x* was given in the form of intravenous injections, commencing with 50 electrostatic units and increasing the amount The blood condition soon became normal, and the treatment was discontinued A relapse occurred, and the thorium *x* was then given in larger quantities, and continued periodically During the nine months treatment 8 000 electrostatic units were given The general condition improved, the blood became normal, and the enlargement of the spleen disappeared The authors add that the dose of thorium *x* must be found experimentally in each case—the blood condition is an indication of the amount required, toxic effects are thus avoided Prolonged observation is necessary

225. Contraindications of Digitalis

E BORDET and J YACOEL (*Arch Mal du Coeur, des Vaisseaux et du Sang*, June, 1924, p 335) observe that in some cases of heart disease digitalis may cease to relieve the patient and may even become dangerous They report three cases *Case 1* —A male, aged 49, with serious cardiac dilatation and frequent crises of angina pectoris There was a history of syphilis at the age of 20, for which he had received three courses of grey oil and one of arsenobenzol, the Wassermann reaction was positive He was very pale and dyspnoeic, complained of retrosternal pain on slight effort, and of many severe anginal attacks on lying down There was a loud double aortic bruit, and the systolic blood pressure was 175 mm Hg There was some hypostatic congestion, the liver was palpable and painful, and the urine was abundant, containing a trace of albumin The heart, especially the left ventricle, was much hypertrophied and dilated After bleeding and purgation he received daily intravenous injections of ouabaine after the second the anginal attacks improved and disappeared later, but returned twenty days subsequently Digitalis was then administered, but the patient's condition was definitely made worse The anginal attacks became more frequent and severe dyspnoea increased, and sphygmograms showed an extension of the dilatation On substituting ouabaine for digitalis the patient's condition improved immediately but he relapsed when digitalis was given again *Case 2* —Male, aged 57, with dyspnoea, precordial pain, left amblyopia due to numerous retinal haemorrhages and a positive Wassermann reaction The systolic blood pressure was 280 mm,

the diastolic 150 mm Hg The aortic sound was loud and clanging and there were signs of cardiac dilatation He received intravenous injections of ouabaine which gave speedy relief, after three months digitalis was given in conjunction with ouabaine, this was well tolerated at first, but later its administration was followed by precordial pain and distress *Case 3*—Male, aged 40, suffered from anginal crises on slight effort, dyspnœa, and occipital headache The Wassermann test was positive, the systolic blood pressure was 240 mm and the diastolic 130 mm Hg There was slight albuminuria The symptoms were immediately relieved by ouabaine (as in the preceding cases), but they were aggravated by digitalis Bordet and Yacoel agree with Vaquez that "ouabaine is a systolic remedy, digitalis is a diastolic one"—that is, the former acts especially during systole, stimulating the stretched weakened muscle fibres, while the latter, by increasing the length of diastole in slowing the rhythm, accentuates the features of the diastolic phase, and gives rise to an increased distension of all the cavities of the heart

Surgery.

226 Ileo colic Volvulus due to Congenital Malformation

KARL BRAEUNIG (*Deut Zeit f Chir*, July, 1924, p 284) describes in detail a very unusual condition found at operation A previously healthy man, aged 21, had had acute strangulation for two days An immediate laparotomy revealed a volvulus of the greater part of the small intestine and of the ascending colon, which had rotated clockwise through 360 degrees The transverse colon lay behind the duodenum, the cæcum and ascending colon were gangrenous and were resected The patient died twenty four hours after the operation The stomach was small and both curvatures were unusually shallow, the pylorus and duodenum were attached to the vertebral column by a short, thick mesentery, behind which the transverse colon lay The splenic flexure and descending colon formed a series of U shaped loops, but were otherwise normal Braeunig discusses the mechanism of this unusual abnormality, he believes that it is due to displacement of the ileum and cæcum, produced by persistence of the omphalo enteric duct, which retards the normal development and descent of the ileum, this in turn producing a backward rotation of the cæcum and ascending colon

227 Duodenal Ileus

M A BRECHOT (*Bull et Mem Soc Nat de Chir*, July 5th, 1924, p 769), reporting two cases observed by M A Charnier, draws attention to duodenal ileus due to compression of the mesentery Such cases are comparatively rare, and the condition has been recognized as somewhat akin to the acute dilatation of the stomach and duodenum sometimes seen after operation In his cases the compression was caused by the mesenteric vessels, and resulted in the symptoms of sub acute duodenal dilatation In the first case symptoms had been present for a long time, with indefinite epigastric and umbilical pain and pain in the right iliac fossa In the second case there were attacks of acute abdominal pain and vomiting, with intervals of complete absence of symptoms The typical case may show attacks of periumbilical pain and profuse bilious vomiting, often there is epigastric distension, and peristaltic movements can be detected in this region There may be no pain between the attacks It is said that duodeno jejunostomy is the operation of choice for this condition, gastro enterostomy does not appear to act satisfactorily with the dilated duodenum The duodeno jejunostomy may be done through the mesocolon, and some add a jejuno jejunostomy in the loop that is anastomosed Most surgeons appear to have performed the anastomosis below the mesocolon Brechot points out that this is not enough in all cases, for in the second of his two cases the symptoms of duodenal distension recurred, and the patient was again operated upon a few days later, when it was found that the anastomotic opening was compressed by an abnormally mobile colon The transverse colon was fixed, and the result has been satisfactory

228 Treatment of Sprains and Dislocations

A SCHWARTZ (*Paris méd*, May 31st, 1924, p 506) maintains that sprains are the type of lesion in which immediate or almost immediate treatment by mobilization is required in order to prevent stiffness of the joint and atrophy of the muscles In the case of the tibio tarsal joint, if the sprain is of moderate intensity a very hot foot bath should be given daily for twenty minutes immediately after the injury, or, if the sprain is very severe, after a few days' rest, it should be followed by massage and mobilization of the joint, and lastly the application of a rather tight Velpeau's bandage The patient should then be allowed to walk in moderation The usual result of this "ambulatory" treatment is that a sprain of the ankle is rapidly and completely cured In the case of traumatic hydrarthrosis of the knee wool and bandage should be applied for about a week to cause absorption of the fluid, but at the same time, from the very first, acute contraction of the muscles of the lower limb, and especially of the quadriceps, should be effected by making the patient extend the limb twice a day for ten or fifteen minutes at a time with a weight attached to his foot At first the patient has difficulty in lifting four or even two pounds, but as soon as he can lift a given weight easily another two pounds should be added At the end of a week the synovial fluid is usually almost completely absorbed In the second week the wool and bandage are omitted unless there is still too much fluid left, and the patient continues the active movements and is allowed to walk a little without bending the knee At the end of a fortnight the same movements of extension are continued, but normal walking is allowed, and as a rule traumatic hydrarthrosis is cured in three weeks In simple traumatic hæmarthrosis similar treatment is employed, but the blood contained in the synovial sac is evacuated by a trocar or by a small incision with the bistoury under the most stringent asepsis Dislocations as a rule should be treated on the same lines, but Schwartz does not recommend immediate mobilization Absolute rest should be enforced, though only for a short time, three days being sufficient to relieve the pain, and mobilization should then be started This is best carried out by the patient himself, first alone and then against a certain resistance, so as to make the muscles work Massage is often injurious and may be the cause of periostosis and hyperostosis

229 Treatment of Elephantiasis

G SAMORINI (*Il Policlinico*, July 14th, 1924, p 904) records a case of elephantiasis of the left leg in a young woman, aged 25, successfully treated by surgical measures The leg first began to swell when the patient was 16 years old, no apparent cause could be found, and it had steadily increased in size The patient married and had one healthy child On admission the greatest difference in circumference between the two limbs was 5½ in, a year after the operation this was reduced to 4/5 in The procedure adopted was to remove at successive intervals of about a week four elliptical lines of skin and subcutaneous tissue from all four aspects of the leg, opening up the aponeurotic fascia in each case so as to allow free drainage of the lymph, the skin being sewn up without drainage The author refers briefly to various theories (mostly unsatisfactory) as to the cause of elephantiasis, and the different methods of surgical treatment adopted

230 Treatment of Phlebitis

A SCHWARTZ (*Paris méd*, May 10th, 1924, p 445) maintains that, though phlebitis in a limb requires an absolute and prolonged immobilization, the immobilization has an injurious effect on the limb, especially on the joints, which become stiff, and on the muscles, which undergo atrophy Mobilization is therefore needed as soon as possible It is usually taught that this may begin four weeks after the fall of the temperature, but it is important that the treatment should not begin until four weeks after the temperature has permanently settled Before allowing the patient to get up gentle and progressive mobilization of the joints should be carried out for ten days by a competent masseur or by the practitioner himself Neglect to carry out this treatment before sending the patient away to a health resort is likely to have disastrous results

231 Fat Embolism following Fractures

R H DAHL (*Tidsskrift f d Norske Laegeforening*, July 1st, 1924, p 610) notes that, according to Backer Grondahl's monograph on the subject, fat embolism of the lungs can almost invariably be demonstrated *post mortem* in cases of fractures of the bones According to the same monograph it is very rare for fat emboli to cause clinical symptoms, and when this is the case death is the usual sequel The author records three cases which occurred within three months of each other, and which were remarkable for the fact that, though there were definite and severe cerebral symptoms, complete recovery was effected The clinical picture was remarkably uniform The patients were men with fractures of the lower limbs, but without injuries to the head Soon after the accidents these patients became drowsy and then comatose, the coma being associated after some time with great restlessness At the same time the pulse and respirations became quicker for a few days, but there was no cyanosis or dyspnœa No relationship could be established between the severity of the injury and the seriousness of the cardiac, pulmonary, and cerebral symptoms, indeed

the patient with the simplest fracture of the thigh showed the greatest pulmonary and cardiac embarrassment and the slightest cerebral symptoms On the other hand, a patient with a severe compound fracture below the knee showed slight cardiac and pulmonary symptoms and severe cerebral symptoms

Anaesthetics

232. Anaesthesia at the Mayo Clinic

W R MEEKER and MARY HINES (*Brit Journ Anaesthesia* July, 1924, p 13) review the progress of anaesthesia during the past ten years, calling attention to the closer co-operation between physician and surgeon, and the preoperative and post operative care with the resulting improvement in operative prognosis and lessened anaesthesia risk When prolonged anaesthesia with relaxation and unconsciousness is desired ether administered by the semi open drop method is the standard anaesthesia at the Mayo Clinic on account of its reliability and general applicability the patient being kept in the best condition for the surgeon with the use of a minimal amount of ether, there being less likelihood of acapnia and very little loss of body heat For short anaesthesias, extra abdominal operations, and where severe shock is anticipated or where there is marked sepsis nitrous oxide and oxygen is useful The present limited experience of the use of ethylene and oxygen points to certain advantages over other gas anaesthetics but, as there is generally some amount of muscular rigidity the addition of ether is necessary to secure relaxation in abdominal operations Local anaesthesia may be indicated in isolated areas where the nerve trunks are easily accessible, in operations about the neck and cranium and in hernias and pelvic operations, but its usefulness varies very much with the operation and the personality and predilection of the patient and surgeon Much that was hoped from it has not materialized, so that it becomes questionable whether for all conditions requiring an anaesthetic other methods are not safer and more efficient In the Mayo Clinic it is used principally in amputations and extensive operations upon the lower extremities in cases in which a general anaesthetic is contraindicated

233 Sacral Anaesthesia in Urology

J KOLISCHER A E JONES and O G SCHNETZER (*Urol and Cut Rev* July 1924 p 384) state that sacral anaesthesia was introduced in 1900 by Cathelin who employed a 2 per cent solution of cocaine Novocain was used in sacral anaesthesia by Stoeckel in 1912 with success in many plastic and perineal operations and by Lawen and Gross in the same year in pelvic operations The present authors from observations on 1 800 cases, most of which were made in the urological clinic of Illyes at Budapest, have come to the conclusion that sacral anaesthesia is a safe method and confers complete analgesia the few failures which they observed were due to defects in technique The only fatalities which have occurred have been in those cases in which the epidural sac was entered The advantages of sacral anaesthesia are that the complications of spinal anaesthesia, such as prolonged headache, vertigo septic meningitis temporary paralysis of the bladder and rectum, and even death are avoided The method produces anaesthesia for two hours which is sufficient for the performance of any urological operation The low dosage of the alkaloid required while sufficient for anaesthetic purposes eliminates the dangers of general intoxication especially when cocaine, novocain, or procain is given with suprarenin

234 Ethylene as an Anaesthetic.

THE comparative value of ethylene as an anaesthetic is discussed by J S LUNDY (*Journ Amer Med Assoc*, August 2nd 1924, p 350) with abstracts and anaesthesia records of illustrative cases He finds that analgesia and anaesthesia with relaxation may be produced very quickly and usually without cyanosis More oxygen can be given with ethylene than with nitrous oxide since ethylene is the more potent of the two it is relatively safe so long as the patient's skin and blood remain pink The chief disadvantage of ethylene anaesthesia is the inflammability of the anaesthetic agent, which is probably no greater than that of ether The odour may be improved by adding a scent to the gas in the mixing chamber The author adds that the after effects are not marked headache nausea and vomiting are usually mild and of short duration The poor relaxation given by ethylene and oxygen in acute peritonitis can be overcome by the addition of a small amount of ether to the mixture Up to May 6th ethylene had been given to two thousand patients at the Mayo Clinic with very satisfactory results A full bibliography is appended

Obstetrics and Gynaecology

235. Inoperable Uterine Cancer

P P COTE (*Brit Journ Radiol* July 1924 p 253) discusses the treatment of inoperable cancer of the uterus by the cold cautery method and with radium Since recurrences after radical operation almost always appear locally in the vaginal vault only 5 per cent developing metastases death in the remaining 55 per cent results from the effects of what is really a local lesion The cold cautery method is stated to destroy cancerous tissue peripherally without destroying normal tissue a temperature of 110 F penetrating throughout the whole mass is sufficient to destroy cancer cells at the periphery of the infiltration A subumbilical incision is made the pelvis being shut off from the abdomen by moist pads The internal iliac artery ovarian vessels, and round ligaments are ligated and then with the patient in the lithotomy position a water cooled vaginal speculum is inserted Through this a cautery, the heat of which is regulated by a rheostat is passed through the cervix until it is felt at the fundus by an assistant's hand grasping the uterus through the abdominal wound When in position a gentle sizzling sound should be audible while the assistant watches the position of the cautery and the amount of heat induced in the portion of tissue under treatment This should be such as to be just bearable by the gloved hand The fundus, cervix and outlying areas in the broad ligaments are dealt with in turn When the vessels cannot be tied the cautery is contraindicated and should be replaced by radium implantation since without ligatures the danger of secondary haemorrhage is considerable Radium treatment is indicated in cases unsuitable for the cold cautery operation when there is risk of fistula formation when recurrence in the vaginal vault has followed a radical operation or when the cervix left after a supravaginal hysterectomy has become involved When possible a tube of 50 mg enclosed in a 1 mm silver filter is placed in the cervical canal and from six to ten radium needles containing 7 or 8 mg enclosed in a 1/2 mm platinum filter, are plunged into the surrounding growth the time of exposure varying from eighteen to twenty four hours, according to dosage Patients so treated have had life prolonged and improved in economic value they were freed until shortly before death from the distressing accompaniments of advanced inoperable uterine cancer

236. Serum Treatment of Puerperal Sepsis.

H BAILEY (*Amer Journ Obstet and Gynecol*, June, 1924, p 638 and July 1924 p 7) recommends the administration of large doses of polyvalent anti streptococcus serum to patients suffering from severe puerperal sepsis Of six patients so treated who had positive intrauterine cultures of *Streptococcus haemolyticus* one died in two of these blood cultures were sterile Of seven patients in whom blood culture was negative and intrauterine culture either negative or not done, one died Allusion is also made to four patients with haemolytic streptococci in the blood following abortion, similarly treated by Williams they all recovered Before the injections the patients were examined for hypersensitiveness and if necessary desensitized by small increasing injections of one drop of 1 c cm during the course of an hour Serum sickness appeared in three fourths of the patients The dose was limited to 100 c cm in twenty four hours The regular occurrence of parametritis after the injections gave the impression that the treatment tended to localize the septic process No local treatment was employed and the patients were kept on an open air balcony The mortality of roughly 15 per cent in this series is compared with that of 60 per cent in a series with proved bacteraemia recently reported by Rosensohn from an adjacent source

237 Pregnancy and the Growth of Malignant Tumours

L LEDEFF (*Zentralbl f Gynak* June 14th p 1289) cites several cases to show that pregnancy has a malign effect on tumour growths In one case symptoms pointing to intracerebral tumour appeared during the latter half of pregnancy The patient grew rapidly worse and when in a moribund condition was delivered by Caesarean section of a living child the necropsy showed a sarcoma of the dura mater invading both cerebral and osseous tissue The case is of special interest because the patient was known to have had the tumour for a considerable time Two years previously a palliative operation had been done and this had been followed by radiotherapy resulting in an apparent cure During the first half of the pregnancy there were no signs of recurrence Another case was that of a woman from whose breast a small carcinomatous lump was excised She refused further operation and was treated by x rays She then became pregnant, but abortion was induced and no recurrence has taken place during a period of six years He quotes

Lindstedt's monograph *Does Pregnancy Predispose to Cancer Growth?* and emphasizes this author's statement that only during the years of fertility are women more liable to cancer than men of the same age He cites another case in which a melanotic sarcoma was removed Eighteen months later the patient became pregnant, and this was followed by rapid and fatal dissemination On the other hand, he quotes several writers to show that pregnancy improves the prognosis in cases of uterine carcinoma He relates the case of a woman in whom a columnar carcinoma was diagnosed in the seventh month of pregnancy with involvement of the vulva and vagina As a palliative measure the uterus was removed, but the entire parametrium was left behind An examination of the pelvic cavity a few weeks later showed that although there had been further spread in the vulva and vagina the parametrium was free from metastasis, and there were no enlarged glands in spite of the fact that the cervix had been entirely replaced by cancer growth The reason why there should be during pregnancy this relatively good prognosis in cases of uterine carcinoma when there is such a bad one in carcinoma of other organs is obscure The analogy between the blood in cancer and in pregnancy (Abderhalden), the increase in antitryptic content in maternal blood (Griefenberg), the weakening of the general system in pregnancy on the one hand and the degree of immunity which it confers on the other, are factors insufficient in themselves to solve this problem Finally, the question arises whether it is justifiable to interrupt pregnancy in cases where a previous operation for cancer has not entirely removed the likelihood of recurrence In the opinion of the author the answer to this is in the affirmative

Pathology.

238 Changes in the Rabic Virus during Adaptation to a Different Host

C LEVADITI, S NICOLAU, and R SCHOEN (*C R Soc de Biologie*, July 18th, 1924, p 423) have made a study of the changes which the rabic virus undergoes in passing from the "street virus" to the "fixed virus" This transformation is consequent on a change of host from the dog to the rabbit These two viruses differ considerably, for instance, the "fixed virus" has a far greater affinity for the nervous system of the rabbit than has the "street virus," and is able to give rise to strictly cellular lesions, moreover, it has lost the capacity to form Negri corpuscles If either of the two viruses be inoculated on to the scarified skin of the rabbit, each of them gives rise to rabies, but if they be injected into the subcutaneous tissue the "street virus" alone is able to give rise to rabies, the other is very much less virulent This appears to be due to the fact that the "fixed virus," by frequent passage through the rabbit, has acquired such a neurotropic tendency that it will no longer grow in tissue of mesoblastic origin Now, if the two viruses be mixed and injected intracerebrially in rabbits, the animals die in eight or nine days, on examination it is found that there is a complete absence of Negri corpuscles in the brain, even though they are present in abundance in control rabbits inoculated with the "street virus" only The explanation of this, they consider, is that the "fixed virus," having a greater neurotropic tendency than the "street virus,' takes possession of the nerve cells and so prevents the "street virus" from multiplying There is, in fact, an antagonism between the two Now, how does the transition—or "mutation," as they call it—take place? By studying seven different strains of "street virus," they found that the tendency to go through the pansporoblastic stage, terminating in the production of the Negri corpuscle, varied in individual cases In some it was very strong, in others it was less developed As these strains were passed through rabbit after rabbit, this tendency to give rise to Negri bodies gradually diminished till it was ultimately lost, and the "street virus" became completely changed into the "fixed virus" The rapidity with which this change took place was greater in those strains which in the first place showed the least tendency towards the formation of Negri bodies It likewise depended on the susceptibility of the rabbit, the greater this was and the more rapidly the disease proved fatal, the sooner did the change occur

239 Tuberculin and the Sedimentation Rate

TEGTMEIER (*Deut med Woch*, July 18th, 1924, p 990) believes that the rate of sedimentation of the erythrocytes after a diagnostic injection of tuberculin often throws valuable light on the patient's reaction to tuberculosis He finds that if an injection of tuberculin is followed in a day by a definite change in the rate of sedimentation, it is most probable that the patient is suffering from active tuberculosis changes of only 2 to 3 mm in the rate of sedimentation are not great enough to warrant this conclusion The test should not be undertaken three or four days before or after menstruation, which may change the rate of sedimentation by as much as 10 mm Other factors likely to alter this rate, such as *x* ray treatment, should also be avoided for fear of misleading findings The change in the rate of sedimentation does not, as a rule, occur on the day after an injection of tuberculin, but on the third and fourth days A series of injections of *increasing doses of tuberculin* in the same patient may be very instructive if controlled by the sedimentation test, which shows whether the patient is getting better or worse, according as the rate of sedimentation becomes slower or faster He considers the sedimentation test a remarkably reliable guide to the dosage of tuberculin, even in the absence of a general and febrile reaction, an increased rate of sedimentation may show that the optimum dose of tuberculin has been exceeded If this warning is ignored, and the injections are continued, they are likely to be harmful Since taking the sedimentation test as a guide to tuberculin dosage, the author has had no injurious focal reactions The sedimentation test also serves the useful purpose of showing the physician when he may rapidly increase the dosage of tuberculin

240 A New Organism in Pulmonary Disease

H R WAHL and R L HADEN (*Journ Amer Med Assoc*, June 28th, 1924, p 1924) publish a preliminary note on an unusual organism occurring in chronic pulmonary disease, which they have detected in four cases by studying fresh unstained preparations of the sputum and by macerating in a strong solution of potassium hydroxide pulmonary lesions detected at necropsy This organism apparently belongs to the Arthrosporiae—a suborder of fungi, which includes the trichophyton family Its shape is pyriform or club shape, it appears to be beaded or divided by septa, and it has a diffuse brown pigmentation It is occasionally found associated with *a small round unpigmented body, with* a roughened surface covered with flattened spurs No mycelium network was detected, the organism only being found in the spore form It probably represents a secondary infection only Localized lesions were produced in rabbits after inoculation with the spores, and histological examination of these lesions showed a granulomatous reaction rather similar to that in actinomycosis

241 The Pulmonary Form of Plague

C NICOLLE and E GOBERT (*Archiv de l'Inst Pasteur de Tunis*, 1924, 13, p 212) have made some observations on the epidemiology of plague which confirm those of previous authors During the years 1907–22 there were several sporadic cases of plague in Tunis, all of which were of the usual bubonic type, associated with plague in rats In 1921 Southern Tunis, which had hitherto been free from the disease, was invaded, and three small outbreaks, all of the bubonic type, occurred in different localities In 1923 the pulmonary form of plague appeared, and during that and the following year a number of foci of the disease were recorded A study of these foci revealed a very marked difference in the epidemiology of the pulmonary form from that of the bubonic form Whereas the latter was constantly associated with the presence of plague in rats and was non contagious, the former was independent of the presence of plague in rats, was highly contagious from patient to patient, and had an extremely high mortality—generally 100 per cent From bacteriological investigations there was no doubt that the causative organism, *B pestis*, was the same in each case, and the question was why in some outbreaks it gave rise to buboes and in others to pneumonia Norman White has suggested that *B pestis* is able to give rise to pneumonia only when it is associated with some other organism, an organism, incidentally, which is non pathogenic to rodents Following up this idea the authors put forward the hypothesis that this other organism is the filtrable virus of influenza Their conception is that when influenza attacks people who are chronic carriers of plague it so lowers their resistance that *B pestis*, which has hitherto lain dormant, finds itself able to invade the lung and give rise to pneumonia This hypothesis presupposes the existence of at least two premisses (1) that chronic carriers of plague do exist, and (2) that epidemics of pulmonary plague occur in close connexion with those of influenza With regard to the first premiss it has been shown quite clearly that healthy men may carry *B pestis* in their inguinal glands With regard to the second, an examination of the records shows that during the years 1923 and 1924 in the Regency of Tunis there was a close correspondence between the presence of pulmonary plague and that of influenza Before influenza broke out there were no cases of pneumonic plague, and as soon as it ceased the cases of plague likewise ceased to occur

VACCINE TREATMENT FOR TUBERCULOSIS

Detoxicated Tubercle Bacillus Vaccine is prepared from virulent strains of Tubercle Bacilli The germs are subjected to mechanical disintegration in the presence of weak alkali which acts as a solvent of the liberated bacterial protoplasm. The waxy or "fatty" portion, forming an insoluble residue, is completely separated by filtration through Berkefeld filters and is discarded, consequently this preparation is a

"DEFATTED" VACCINE

as well as a Detoxicated Vaccine

(See BRITISH MEDICAL JOURNAL, *7th July, 1923)*

A large quantity of this Vaccine is now available.

MAGISAL

Crush a MAGISAL TABLET (Martindale's Magical Aspirin) and stir it in a teaspoonful or two of water It dissolves completely
Do the same with an Aspirin Tablet (anybody's make) and note that it does not dissolve, or to be precise, a minute proportion of it only dissolves
The solubility of MAGISAL is 1 in 12, that of Aspirin 1 in 300
For prompt effect as an anti rheumatic anti neuralgic, and influenza remedy please prescribe MAGISAL

Bottles of 50 Tablets - - 2/6

The Management of an Infant's Diet

The use of Mellin's Food in cases of Malnutrition, Marasmus or Atrophy

MELLIN'S FOOD 4 level tablespoonsful SKIMMED MILK 8 fluid ounces WATER 8 fluid ounces	*Analysis*	FAT	49
		PROTEIN	2.28
		CARBOHYDRATES	6 59
		SALTS	58
		WATER	90 06
			100 00

The principal carbohydrate in MELLIN'S FOOD is maltose, which it is admitted is particularly well adapted to the feeding of poorly nourished infants Marked benefit may be expected by beginning with the above formular and gradually increasing the MELLIN'S FOOD until a gain in weight is observed. Relatively large amounts of MELLIN'S FOOD may be given, as maltose is immediately available nutrition.

Mellin's Food

The limit of assimilation for maltose is much higher than for other sugars, and the reason for increasing this energy-giving carbohydrate is the minimum amount of fat in the diet made necessary from the well known inability of marasmic infants to digest enough fat to satisfy their nutritive needs

Samples, etc, free to Members of the Medical Profession from
MELLIN'S FOOD LIMITED, LONDON, S E 15

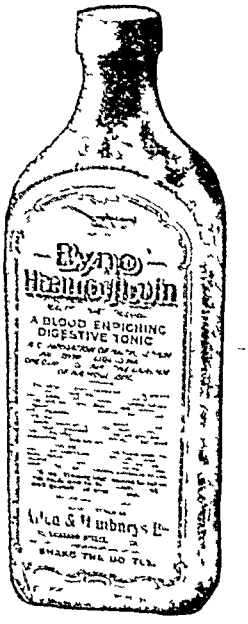
FELT PRODUCTS (SPHAGNOL) LTD Dept D 29 1819, QUEENHITHE, LONDON E C 4

For the Anæmias

'BYNO' Hæmoglobin



Trade Mark

A Blood-Forming Restorative containing active Organic Iron

"Byno" Hæmoglobin is a preparation of "Bynin" Liquid Extract of Malt, containing 15 per cent of purified hæmoglobin prepared by a special process which conserves its physical properties and therapeutic activity The Malt extract provides a most suitable vehicle for the hæmoglobin and adds valuable nutritive and digestive properties to the preparation "Byno" Hæmoglobin does not induce constipation

Clinical experience has confirmed the experiments demonstrating the great superiority of Hæmoglobin over Blaud's Pill and other inorganic Iron compounds in regard to its effect on increasing the hæmoglobin content of the blood

The value of "Byno" Hæmoglobin in all impoverished blood conditions has been amply proved It is specially indicated in the anæmias, pernicious and simple, in debility due to malnutrition or menstrual disorders; also in convalescence, particularly after wasting or infectious diseases

JUST PUBLISHED Crown 8vo 10s. 6d net postage 6d.

AN INTRODUCTION TO FORENSIC MEDICINE.

For Medical Students and Practitioners

By **H A BURRIDGE**, M A M B Dub Associate of King's College London and Lecturer on Forensic Medicine and Toxicology in the King's College Medical School (University of London)

NOW READY SECOND EDITION With 197 Illustrations Oblong Imperial 4to 30s net postage 9d

A SYSTEM OF RADIOGRAPHY.

With an Atlas of the Normal.

By the late W HIPONSIDE BRUCE M D

Revised by J MAGNUS REDDING, F R C S., Senior Surgical Radiographer Guy's Hospital Consulting Radiologist Edenbridge Hospital &c

Extract from Preface of Second Edition.— The illustrations of this Edition have been carefully worked out by the general scheme and arrangement of the book remains unchanged. A departure from the form of edition is the placing of more than one illustration on the same page. This economises space and has enabled the eighty-eight additional figures to be printed without increasing the number of pages"

ELEVENTH EDITION Thoroughly Revised. Crown 8vo 16s net postage 9d

ELEMENTS OF PRACTICAL MEDICINE.

By **ALFRED H. CARTER**, M D M.Sc F R C P.Lond. formerly Professor of Medicine University of Birmingham. Edited by **A. G GIBSON**, M D Oxon. B Sc. M.A. F R C P., Lecturer in Morbid Anatomy University of Oxford, &c.

It provides a safe guide to Clinical Medicine and possesses the merit of simplicity ... The book is well deserving of the wide circulation that it has obtained."—*The Lancet*.

TWO IMPORTANT NEW BOOKS

NOW READY

TEXT-BOOK OF PATHOLOGY

By **ROBERT MUIR,**
M A, M D, Sc D, F R S,
Professor of Pathology, University of Glasgow, Pathologist to the Western Infirmary, Glasgow

viii + 774 pages medium 8vo With more than 420 Original Illustrations

35/- net.

In his preface the author states that this book is primarily intended as a text book for students, but coming as it does from the pen of a hospital pathologist and teacher with Professor Muir's long experience, it will have a much wider appeal and will be welcomed by all those practitioners of medicine and surgery to whom the problems connected with the etiology and processes of disease are of fundamental interest The author's aim has been to give a general view of modern pathology, both general and special, and along with his description of the changes brought about by disease in the tissues and organs of the body he has incorporated the results of experimental and chemical research

READY NEXT WEEK

A TEXT-BOOK OF PHYSIOLOGY

By **H. E. ROAF,**
D Sc Liverpool, M R C S, L R C P,
Professor of Physiology, London Hospital Medical College, University of London

viii + 606 pages With 325 Illustrations

25/- net.

"The subject of Physiology has grown to such large dimensions that it is impossible for a student to assimilate sufficient of it in the short time devoted to its study unless the material is presented to him in a *systematic* manner" In this sentence from the Preface the author indicates the outstanding feature of this new text book of Physiology

To carry out his purpose Professor Roaf has arranged his material in such a way that the student, already familiar with elementary Physics and Chemistry, is first of all introduced to the study of the gross mechanical processes in living structures, and from this starting point is then led on through sections of the book dealing with the more intricate details of bodily activity to a consideration of wider and more general biological problems

THE

New Jaeger Underwear

A Consulting Physician writes —

'In my opinion this invention of a Two layer Stockinet weave constitutes a distinct advance The layers are so ingeniously woven that for all practical purposes the material behaves as a single fabric whilst the air contained within the meshes acts as a bad conductor of heat renders the garments more hygienic and at the same time lighter in weight than their somewhat bulky winter weight predecessors

In wear the fabric is warm and comfortable, and the texture is fine enough not to be irritating"

Intestinal Disinfection

No. 7

FLATULENCE AND ALIMENTARY FETOR

MANY conditions are associated with flatulence some of which frequently give rise to embarrassment of distant organs

Dyspepsia catarrh and ulceration of the stomach and intestine cancer dysentery and other diseases of the alimentary canal itself, neurasthenia and diseases of the heart, liver and pancreas to name only a few may all be associated with flatulence and intestinal flatus

Some of the diseases of the intestine such as dysentery and cancer are often also associated with horrible fetor of the evacuations

The accumulation of flatus in the stomach and intestine is liable to embarrass the action of the heart and lungs giving rise to dyspnœa disordered action of the heart faintness and even anginal attacks

Both the flatulence and fetor are the result of abnormal fermentation and putrefaction of the contents of the alimentary canal apart from treatment of the condition itself it can be rationally controlled by the use of an efficient intestinal disinfectant For this purpose KEROL the most potent germicide being unabsorbed and non toxic is unsurpassed and can be administered in sufficient amount to exert its germicidal action

When the fermentation is located in the stomach Kerol Capsules (Gastric) m 3 should be administered one or two may be given three or four times a day after meals

When there is intestinal flatus and fetor the Keratin-coated Kerol Capsules m 3 should be used the dose being one to three after meals

KEROL CAPSULES

The Value of Marmite in Marasmic conditions

IN many cases of Marasmus the wasted condition of the body has been found to be due not only to malnutrition in the sense that insufficient food had been supplied, but to an inability to assimilate essential fats owing to a deficiency of Vitamin B.

Apart from its function as a preventive of Beri-Beri, Vitamin B has a distinct influence upon the normal growth and health of the body Of all the known accessory food factors, it is Vitamin B which promotes the ready absorption of fats and consequently increases the powers of resistance to disease

Medical men will find in Marmite a palatable and readily available preparation and a food richer than any other in Vitamin B It is an extract of yeast extremely pleasant to the taste, and may be recommended to be used in soups, stews, gravies, etc, or in the form of sandwiches

Marmite

Medical Practitioners are invited to write for a sample of Marmite, together with full evidence of its usefulness

THE MARMITE FOOD EXTRACT CO, LTD, 59, EASTCHEAP, LONDON, E C 3

WYLEYS LIMITED WHOLESALE DRUGGISTS COVENTRY. Established 1750.

We were the first English manufacturers of Oval Gelatine Coated Pills, and for upwards of 40 years these have been in constant demand amongst medical men In form, appearance and efficacy, cannot be equalled We hold a stock of all Pills in general demand and give the following as examples —

G235	Anti Malarial Each containing Quinine Sulph 1½ grs Phenacetin ½ gr Aloin 1/20 gr Podophyllin 1/30 gr	4/6
G208	Damiana Co — *Ext Damianæ gr 1 Ext Cocæ gr 1 Ext Nuc Vomicæ gr ¼ Phosphori gr 1/200*	2/6

72, Oxford Street, London W.1.

PARATHYROID & CALCIUM THERAPY

Elixir Parathyroid (SQUIRE) and **Elixir Parathyroid with Calcium** (SQUIRE)

The internal secretions of the Parathyroid Glands have been found to play an important part in the process of assimilation and retention of Calcium in the tissues and in consequence, to exert a considerable influence on the nervous system and building processes.

There is abundant evidence that Parathyroid insufficiency may be compensated by the oral administration of the Parathyroid secretions.

The above Elixirs present in an agreeable and useful form the hormones of the Parathyroid Glands alone and in combination with a freshly prepared Calcium Lactate. The preparations are specially indicated in TETANY, SPRUE, HALOLYSIS AGITANS, certain forms of EPILEPSY and in conditions of chronic SEPSIS such as varicose and duodenal ulcers. In the treatment of CHILBLAINS excellent results have been obtained.

Elixir of Parathyroid contains 1/10th of a grain of dried Parathyroid substance in each fluid drachm. DOSE—½ to 1 teaspoonful.
Elixir of Parathyroid with Calcium contains 1/10th of a grain of dried Parathyroid substance and 2 grains of Calcium Lactate in each fluid drachm. DOSE—½ to 1 teaspoonful daily.

The Elixirs are put up in Bottles containing 4 ozs 8 ozs and 16 ozs each

HALITOSIS

(AS DEFINED IN THE CENTURY DICTIONARY)

(Halitosis) N. L.

(L. Halitus—Breath + Osis—Offensive)

Offensive breath, whether arising from diseased or neglected conditions of the teeth, mouth or nose or caused by disorders of digestion, respiration, the excessive use of tobacco, etc., may be readily overcome by the deodorizing properties of—

LISTERINE

Listerine is strictly antizymotic, it inhibits alike the acid fermentation of carbohydrates and the alkaline putrefactive processes of mixtures of meat and saliva, retained as debris about the teeth, hence, Listerine is antagonistic to the activating enzymes of fermentation so often the cause of Halitosis.

The volatile antiseptic constituents of Listerine-thyme, eucalyptus, gaultheria and mentha, combined with baptisia, boric acid, rectified spirits and water have a stimulating effect upon the stomach and in proportion to the dose, an action inhibitive to fermentation of its contents, hence, Listerine is often corrective of those disorders associated with the endo-development of gases and acid eructations. A large tablespoon of Listerine in a wineglass of hot water will afford immediate relief.

TRADE MARK "ALOCOL" BRAND
Colloidal Hydroxide of Aluminium

Modern medical experience has proven that while the usual alkalis and oxides possess power for neutralizing the normal or abnormal acids of the stomach their action is only symptomatic and transitory They may give momentary relief to the painful condition, but they also have the effect of aggravating the morbid condition For this reason they are distinctly contra indicated, especially in stubborn cases

"Alocol does not neutralize acid it absorbs the excess colloido chemically and at the same time leaves a sufficiency for normal gastric digestion The out standing advantage of Alocol' as an antacid is that it removes from the stomach the excess of the acid radicle (Cl) instead of merely temporarily neutralizing it 'Alocol can be used for prolonged periods without the slightest harmful effect

A supply for clinical trial with full descriptive literature sent free on request

M 197

"Alocol" is indicated in all conditions in which diagnosis reveals high gastric acidity It is particularly valuable in the treatment of chronic affections of the stomach, the dyspepsias especially those of pregnancy gastric and duodenal ulcer, gastrosuccorrhea and in conditions characterized by gastralgia, pyrosis, flatulence acid eructation and other symptoms common to gastric disease

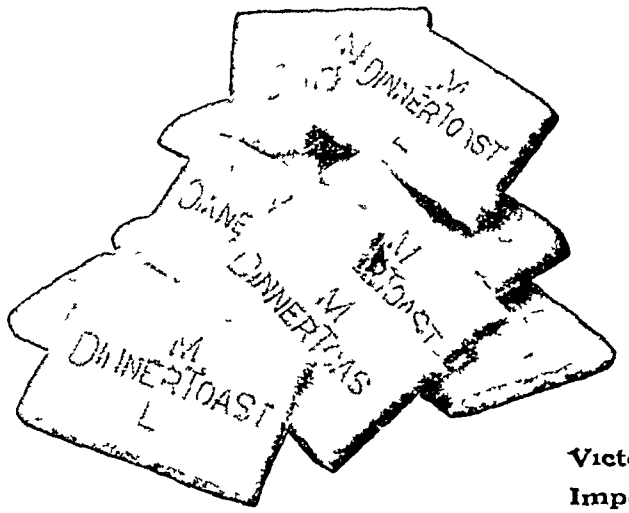
Roboleine

Justifies its recommendation because its worth has been amply proved by medical men for the past 18 years

To the practitioner who seeks a reconstructive of the very highest quality, it is sufficient to state the formula of 'Roboleine' at once it will be seen that here is a correctly balanced food of the highest nutritive qualities

THE FORMULA IS:

MARROW
from the long bones of prime oxen
RED MARROW
from the rib bones of prime oxen
CREAM OF MALT
(Described by *The Lancet* as the 'creme de la creme of malt extracts')
Egg Yolk, Neutralized Lemon Juice



In slow convalescence due to weakened digestive functions, 'Roboleine' is especially valuable, for it is assimilated with ease when other foods are rejected

An advance in the Science of Nutrition

(1) *The extraction of the active principle of Cod Liver Oil*

In first announcing GLAX-OVO, the fragrant food-drink, the makers wish to draw particular attention to its incorporation of a Vitamin Concentrate This new product is a concentration of the active principle of Cod Liver Oil, from which it has been extracted as a tasteless and odourless product retaining its efficacy

It will no doubt be agreed that the beneficial action of Cod Liver Oil is primarily due to its containing the anti-rachitic Vitamin In the Vitamin Concentrate in GLAX-OVO, Vitamin A* is present in 2000 times its strength in the source from which it is extracted

GLAX-OVO, which alone contains Vitamin A Concentrate, is thus claimed to be a potent source of the anti rachitic Vitamin The milk, malt, barley kernels and cocoa in GLAX-OVO give it high nourishing power, and a pleasant fragrance and flavour

Its adequate Vitamin content, particularly as regards the anti-rachitic Vitamin, indicates GLAX-OVO as very suitable for growing children In all cases where ordinary diet needs well-balanced food which arouses appetite and is easy to digest and assimilate, GLAX-OVO is suggested

*As most recent research suggests that there are two Fat-Soluble Factors, the Glaxo Laboratories, for the sake of convenience in this series of announcements, propose to term them Vitamin A1, and Vitamin A2—the anti-xeropthalmic and anti-rachitic Vitamins respectively

GLAX-OVO

Fat	13 3%
Protein	18 3%
Carbohydrates	62 2%

The "BRITISH MEDICAL JOURNAL" says
"Benger's Food has by its excellence established a reputation of its own."

Benger's Food is standardised by the Medical Profession for all illnesses involving or arising from weakness of the digestive system in Infants, Invalids and the Aged.

By means of Benger's Food, fresh cows' milk can safely be given even to the weakest stomachs Benger's Food contains the active enzymes of natural digestion (*Amylopsin* and *Trypsin*), which act upon the casein of milk and the farinaceous material of the Food in such a manner as to render them easy assimilable

The precise degree of digestibility of Benger's Food can be regulated by allowing the mixture to stand for a varying period at one stage of its preparation. A useful average period is 15 minutes, but in extreme cases, and with very young infants, this can be increased to 30 minutes or more

NOTE—COMPLETE PRE-DIGESTION OF BENGER'S FOOD AND MILK IS NOT POSSIBLE As health and natural digestion improve the extent of the PARTIAL self-digestion of the Benger's Food and milk may be gradually reduced The digestive organs can in this way be given a suitably-regulated exercise for steady progress to ordinary diet

Benger's Food is itself of high food value, and with milk provides a complete food in the form of a delicate cream, rich in nutrition

No Soap—No Chalk No Magnesia

The old theory was to apply an alkaline dentifrice, to neutralize mouth acids

Modern research proved the fallacy of that An alkaline product, in its reaction, reduces the alkaline index of the saliva Mild acids, like fruit acids, have the opposite effect.

Of course, constant alkalinity is better than transient alkalinity Nature's methods are better than artificial methods So Pepsodent is mildly acid, to conform with these modern principles It omits all alkaline products.

Some mild acid effects

Peoples who eat much fruit, as in the Tropics, are notable for well-protected teeth Pepsodent applies a like principle in a twice-daily way

Mild acidity increases the salivary flow and reduces its viscosity. It increases both the alkaline index and the ptyalin index The ptyalin is there to digest starch deposits on teeth

Mild acidity acts to curdle fresh mucin plaque, and to disintegrate the plaque at all stages of formation

Nature intended these results from diet But modern diet too often fails to bring them

---

Then Pepsodent includes an ideal polishing agent, far softer than enamel —efficient in removing the curdled or disintegrated plaque Exhaustive tests have proved it harmless to enamel

We want all practitioners to have a complete understanding of Pepsodent's principles and effects Let us send you authoritative literature.

TRADE MARK 'TABLOID' BRAND (Hypodermic)

INSULIN HYDROCHLORIDE

(Sterile) 10 UNITS

'TABLOID' Hypodermic INSULIN HYDROCHLORIDE represents an important step forward in the progressive work on Insulin associated with Burroughs Wellcome & Co

It is prepared at the 'Wellcome' Chemical Works, under conditions approved by the British Medical Research Council

The method of sterilisation is as rigorous as that applied to materials and instruments for operations

Among other outstanding advantages —

Each dose may be prepared in the syringe barrel as required

The solution may be made of any desirable strength

There is no loss of solution in filling the syringe

The products are sterile, stable, accurate in dosage, quickly soluble, portable and convenient

'TABLOID' Hypodermic INSULIN HYDROCHLORIDE is supplied to the Medical Profession in two packings —

No 150 Cartons containing 10 products in ONE tube

No 152 Cartons of 10 tubes each containing ONE product

Solutions may be made of any desirable strength

SECTION OF SURGERY

Sir Cuthbert Wallace, K.C.M.G., C.B., F.R.C.S., President

DISCUSSION ON ACUTE OSTEOMYELITIS

OPENING PAPER

BY

JOHN FRASER, M.D., F.R.C.S.Edin.,

Surgeon Royal Hospital for Sick Children, Edinburgh; Assistant Surgeon Royal Infirmary, Edinburgh

The subject of osteomyelitis is a large one, and I have been somewhat at a loss to know how best to present the various aspects of the problem. I may review the literature presented up to date, stating the views of others and recounting their results, or I may relate personal experiences and beliefs. I have decided to choose the latter course. In a paper of this description, short as it must necessarily be, it is impossible completely to survey the published works of others, and if a review cannot be complete it is better left unsaid. But a stronger influence has been the desire that one's personal views should meet with criticism and analysis. There is an old Scots saying that "Every crow thinks its ain bairn the blackest," and the belief is by no means confined to the order of Passeres. We suffer from it as badly as do the crows, but, as the hot breath of corn winnows the chaff from the wheat, if you will refine my errors and correct my mistakes I shall value your honest criticism.

First let me present the understanding which we have of the place nomenclature of the average bone, for the terms are alluded to in the subsequent text. We recognize the shaft of the bone or the *diaphysis*, at one or both extremities the *epiphysis* is distinctive as long as there is growth in length, and it is separated from the related diaphysis by the plate of the *epiphyseal cartilage*. That portion of the diaphysis which is adjacent to the epiphyseal cartilage has such distinctive and important characteristics that it is worthy of a special name, and, since the researches of Lexer, it has been termed the *metaphysis*. Diaphysis, epiphysis, epiphyseal cartilage, and metaphysis are therefore the place names to which allusion will constantly be made, and of the four the metaphysis is pre-eminently the most important as far as the pathology of inflammation is concerned.

The reasons for its importance are apparent. Existing as it does between the epiphyseal cartilage and the diaphysis, it is the site during the years of growth of the most intense cell activity, and as a natural corollary it is the most vascular area of the bone. Three out of four of the independent sources of blood supply to the growing bone open by direct routes into the zone of the metaphysis, and the blood stream of the fourth source is indirectly related to it. There is, I believe, a consensus of agreement that the metaphysis is the site of origin of most or the inflammatory diseases of bone and of acute osteomyelitis in common with others.

The Origin of the Disease

In its beginnings the disease is essentially an infective process of the interior of the bone, the endosteum and the marrow are the sites of the disorder, and if we are to be etymologically correct *endosteomyelitis* is the proper and descriptive nomenclature. A primary periostitis is the rarest possible event, it may occur as the result of a spread by contiguity from a neighbouring focus in the maxillae and the ribs, but where primary bone infections are concerned it is invariably secondary to a medullary infection. It is perhaps unnecessary to have alluded to this point, for any error which may have existed has probably been dissipated long ago, but in the operative treatment of osteomyelitis the tragedy of incomplete intervention is traceable to an erroneous conception of the sequence of events.

Acute osteomyelitis is the result of an acute pyogenic infection localized in its early stage to the metaphysis of the bone, it is a disease of youth, an affection of the age of growth. An inquirer will naturally follow this statement by three questions:

(1) How does the infecting organism gain entrance to the metaphysis?

(2) What are the influences which localize the infection to a certain locality?

(3) What are the organisms responsible for the disease?

1. *The Route of Infection*

The vast majority of the cases are examples of a blood-borne infection. This statement is one which we believe to have been established beyond any question or doubt, there is the most convincing clinical evidence, and the sequence of events has been reproduced experimentally by the researches of Schüller, Krause, Muller and particularly by Salvia. In a few exceptional cases the infection enters the bone from a neighbouring focus of inflammatory disease, and examples of this occurrence are met with in the instances of osteomyelitis which follow infection of neighbouring joints. In this event the spread is by the perivascular lymphatics, in a few cases possibly by direct spread, and the epiphysis is more liable to the infection than the metaphysis.

Believing, therefore, that acute osteomyelitis is a blood-borne disease, we must assume that a pre-existing blood infection exists. The septicaemia (for it is none else) is of a peculiarly mild type, for it is correct to say that in the case history of the average osteomyelitis it is unusual to find evidence of a pre-existing blood infection. If we are to accredit the recently published work of Lip chiz we must recast our conception of the incidence of blood infection in children, for, according to this author, "the occurrence is the rule rather than the exception." I confess I have been impressed by the results which he has produced and I believe that we must give the possibility of the event a fuller consideration than it has been accorded in the past. There is something reasonable in the view that in the early years of life, before any degree of artificial immunity has been acquired and while the child has to rely on the extent of its natural immunity, contact with even the minor infections may result in a blood infection. The event has an obvious bearing on the development of osteomyelitis.

What are the sources from which the infection comes? The septic tooth, the infected tonsil, inflammation of the sinuses, furunculosis of the skin are well recognized points of entrance; pneumonia and the exanthemata are less frequently responsible. But there is another source the importance of which I am convinced is not yet appreciated in surgical work—I allude to umbilical sepsis. I have recently collected the records of some thirty cases of umbilical sepsis in newborn babies complicated by a pyaemic process and metastatic foci of osteomyelitis. The collection is derived from the observations of the last four years; the cases have been the most serious examples of the disease—a fatal result would appear to be almost inevitable—and though this may be the most serious aspect of the question I have a suspicion that in a considerable number of cases umbilical sepsis is the medium through which a blood infection is induced. You may be inclined to question the possibility of a blood infection incurred at birth existing until the years or later childhood but I know of no evidence which would discredit it. This question of umbilical sepsis is of considerable practical importance. I make no claim to any knowledge of obstetrics but from inquiries which I have instituted I am informed that the highly absorptive area of the divided umbilical cord in close proximity to, and in direct communication with, the viral abdominal organs, is often treated with indifference to either aseptic or antiseptic measures. I put umbilical sepsis as a very potent factor in the production of the blood infection of infants, and therefore I look upon it as closely related to the development of osteomyelitis at a later age.

2 *The Influences which Localize the Infection*

The evidence of large numbers of statistics has shown that certain localities of the osseous system are particularly liable to be affected by the disease Our experience has been that the upper end of the tibia, the lower end of the femur, the lower end of the tibia, and the upper end of the humerus are the common sites, occurring in the order stated Influences must exist which control this distribution, and, though the matter may only be of academic importance, it is of interest to surmise what these influences are

Trauma is the first to suggest itself, and it is generally accepted as an influence of great importance The experiments of Pietrikowski support it from an experimental point of view It explains the high proportion of incidence in boys, the frequency with which the lower limbs are affected, and particularly those situations which are most exposed to injury The trauma is slight in degree, and the influence which it exerts results in the production of a small metaphyseal haemorrhage, which, though minor in extent, is sufficient to arrest the circulating organism and so localize the disease

The surface extent of the metaphysis is the second influence The larger the extent of the metaphyseal surface the greater must be the proportion of the blood supply, and the more intense the cellular activity of the region —two factors which, in combination with others, predispose to the development of inflammatory disease Kellogg Speed has discussed the influence of the nutrient vessels upon the localization of the disease The direction of the nutrient vessels from the knee and towards the elbow is a stable anatomical condition, and it was long ago suggested that the disease tended to be most common at the bone extremity towards which the nutrient artery was directed If our statistics are to be trusted, the very reverse is the case, for the osseous relations around the knee are the sites of election

Mathers has suggested that, where an individual bone is concerned, the epiphysis which is latest in uniting indicates the locality which the disease is most liable to affect, and in this way he explains the frequency with which the bones around the knee are involved

I am doubtful, however, whether the direction of the nutrient vessels or the time influence of the epiphyseal cartilage has any bearing upon the locality of the disease The devitalizing effects of cold and trauma, and the predisposing influences of the surface extent of the metaphysis, are the factors of which we have any real knowledge

3 *The Organisms Responsible for the Disease*

This aspect of the question may be dismissed in a few words I have analysed the results of the bacteriological examination in 400 cases to which I have had access, and the statistics are as follows

Organisms present	Percentage
Staphylococcus aureus	78
Staphylococcus albus	2
Streptococcus pyogenes	6
Pneumococcus	14
B coli communis	1 case
B typhosus	3 cases

The proportion of incidence of the individual infections is very similar to that recorded in various statistical collections The percentage of pneumococcal infection may be considered unusually high, but this group has been very carefully controlled, and, as will presently be shown, we attach considerable importance to this class of the disease

Influence of Age and Sex

The disease is more common in boys than in girls in a proportion of six to one We have plotted out the age incidence, and we have found a reading similar to that recorded by so many others, that a period from the eighth to the twelfth year is that in which the disease most frequently occurs These are subsidiary facts in the etiological picture which indicate the influence of trauma in the occurrence of the disease.

The Pathology of the Disease

It is not my intention to reiterate the well recognized general facts of the pathology of the disease, these paths have been well trodden I would rather present one or two special aspects of the picture

I have already indicated the belief that where osteomyelitis of the long bones is concerned the vast majority of the cases begin as a metaphysitis Diaphysitis is secondary to a metaphysitis, and I have yet to see the case of acute osteomyelitis which began in the centre of the diaphysis

It is sometimes stated that the epiphysis may be the primary site of the disease as far as the bone is concerned This is true, but in actual fact the epiphysitis is invariably secondary to pre-existing infection of its related joint It is apparent that these points are of great practical importance where operative interference is concerned

I find it helpful to correlate the pathology of the disease with its clinical features There is the primary intense infection of the medulla, inflammatory products and exudates are under extreme tension, and because of this dynamic feature local symptoms are intense and absorption of toxins or organisms most manifest It is the primary stage of acute osteomyelitis, and from a prognostic point of view the most dangerous stage, because it is that in which septicaemia is most likely to occur It is impossible to detail in a paper of this description the various stages in the progress of the endosteomyelitis, but I would recall the interesting observation of the late Sir William Macewen that within a few hours of the onset of an acute medullary infection the osteoblasts of the interior have migrated *en masse* to the deeper layers of the periosteum—a striking demonstration of the antichemiotactic response on the part of that highly specialized and most sensitive cell Pus formation in the medulla of the bone is the natural sequence of this primary and central phase of the disease

The second stage is evidenced by a spread of the infection from the interior into the subperiosteal area The vessels and spaces of the Haversian canals are the routes along which the migration occurs, and a serous subperiosteal effusion is the precursor of a purulent one Relief of tension is the characteristic of the second stage, the urgency of the symptoms abates and the prognosis improves, because the risks of a massive invasion of the blood stream are now lessened The earlier the second stage appears in the progress of the case the better is the prognosis, and the most fatal examples of the disease are those in which the second stage has failed to develop

Because the existence of the Haversian canal is the factor upon which the appearance of the second stage depends, it would seem that the proportion of these canals in different bones may have an influence upon the progress of the disease I find that fifty years ago August Schiller, in a thesis which he presented to the University of Freiburg, estimated for physiological reasons the relative number of Haversian canals in different bones He found that of the various long bones the femur is the one in which the proportion of Haversian canals is least, as estimated by the number of Haversian canals the humerus and the tibia are three times more porous than the femur We have nothing to do with the physiological problem which Schiller discussed, but from our point of view the work has this interesting application—that the more porous the bone the earlier is the appearance of the second stage of pathology and the better is the prognosis

We associate the third stage of pathology with the phenomenon of reaction Relief has been achieved through the medium of operation or by a spontaneous rupture of the infection through the periosteum and the overlying soft tissues Congestion has activated the osteoblasts in the deeper layers of the periosteum, and Macewen has shown how their numbers are reinforced at the commencement of the disease The result of this activity is seen in the involucrum which now begins to be deposited around the periphery of the original shaft It is unnecessary to detail the further phases of this stage—the persistence of medullary infection and its relief through the cloacae of the involucrum, the appearance of granulation tissue in the

interior of the bone, its active phagocytic influence upon the necrotic bone, so that the latter is either entirely removed or is separated from the living tissue as a sequestrum, and a final stage, when a new shaft is remodelled and the involucrum removed through the medium of the osteoclast

As I am anxious to speak of the treatment of the disease, and as my remarks have already occupied more space than is permitted to me, I shall dismiss the various aspects of clinical features, diagnosis, and prognosis in a few words

Clinical Features

The clinical features are intense and distinctive There is the agonizing pain of the early stage while the infection is still locked up under tension in the interior of the bone It is during this stage that the signs of toxaemia—the high temperature, the delirium, the poisoned appearance—are greatest It is at this stage that a massive invasion of the blood stream may inaugurate a septicaemia which by its intensity overshadows the local signs

With the relief of tension which characterizes the stage of subperiosteal effusion there is an immediate abatement of signs and symptoms—the pain diminishes, the temperature falls, the general appearance improves There is an element of danger in this stage because the sudden relief in symptoms may raise doubts as to the veracity of the diagnosis Thereafter, in the absence of relief treatment, the signs and symptoms are re-established as the tension again rises, and the features are those of local septic infection

Diagnosis

The diagnosis is usually established without much difficulty The intensity of the local symptoms and the evidence of an unusual degree of toxic absorption are the characteristic features of the disease Local difficulties arise under certain peculiarities of position and depth from the surface For example, acute osteomyelitis of the ilium may simulate either acute abdominal disease or acute infection of the hip-joint because of its proximity to these two regions Osteomyelitis of the femur may be difficult to recognize because of the depth at which the bone lies from the surface

As far as the differential diagnosis is concerned, acute rheumatism and cellulitis are the conditions in which mistakes may arise The confusion of osteomyelitis with acute rheumatism should not occur, because the distinctions between the two conditions are perfectly well defined, in the event of difficulty arising a blood count may be of value, because the white cell count is so much higher in osteomyelitis than in rheumatism The possibility of confusion with cellulitis appears when the soft tissue infection overlies a bone, the intense degree of general illness in osteomyelitis is then a distinguishing feature of great value

Prognosis

The prognosis may be said to be controlled by one or two special features The general rule may be formulated that the more distal the focus of infection the more favourable is the prognosis The infection of bones which lie in proximity to vital organs (as, for example, the skull bones and the pelvis) is necessarily a serious development The more porous the bone and the earlier the appearance of the subperiosteal effusion, the more favourable is the outlook The real danger lies in the septicaemia which may develop during the first stage of the disease

Our experience is that age has comparatively little influence upon the prognosis unless it be that the younger the child the greater is the tendency to septicaemia

The Treatment of Osteomyelitis

It is both natural and convenient that our considerations of treatment should fall into two groups—local and general

Local Treatment

I wish to introduce this portion of the discussion with a question which may appear somewhat heterodox The question is as follows Is there any variety or type of acute osteomyelitis in which immediate operation is inadvisable? We are in universal agreement regarding the necessity for surgical operation in the great majority of cases in general we concur with Warbasse when he wrote Without surgery osteomyelitis is a serious disease even in its mildest form, and with surgery it is hopeful in its worst stages," but are we to accept the universality of surgical interference? I think not I confess I make the reservation with some hesitation, but I believe in its importance The pathologist recognizes a serous or albuminous type of osteomyelitis From observations which we have made we believe that the bacteriology of this type is almost invariably pneumococcal, and our clinical experience has been that a considerable proportion of these cases subside without operative interference In fact, I go so far as to say that in this class of case operation in the early stages is actually harmful, for it may result in dissemination of the disease, and it certainly is followed by soft tissue suppuration and sequestrum formation

Certain peculiarities indicate this special variety or case It affects babies and young children, the temperature is rarely as high as in the ordinary suppurative osteomyelitis, the evidences of toxaemia are slight in degree, and the joint which is associated with the affected bone is usually the site of a serous effusion Under these conditions we suspect that the infection is of the serous and pneumococcal type, a blood count is therefore taken, and it demonstrates a degree of leucocytosis which is very much less than that which appears in the suppurative variety

In this type of case we delay operation, extension is applied to the limb fixation splints are employed, hot local applications are used, and the pain is relieved by the administration of chloral and bromide In a considerable proportion of cases the temperature falls the pain disappears and the child regains his general health Occasionally suppuration may ensue, but it is *local* in its extent, its presence is suspected if the temperature rises after a preliminary *fall*, if pain persists or if *local* redness or oedema appears, and the development of the focus is followed by repeated *x*-ray examination With the establishment of a definite focus of suppuration relief is obtained by a single trephine opening

We have been repeatedly impressed by the value of the recognition of this special type of the disease

The Local Treatment in the Ordinary Case —The ordinary case permits or no delay, because it is by the relief of the medullary tension in the early stages of the disease that the infection is arrested, the risks of septicaemia reduced, and the extent of sequestrum formation minimized The marrow cavity is exposed in such a way that efficient drainage is established, and in accomplishing this we follow a routine method The affected segment of bone is exposed through an appropriate incision and, recognizing that the metaphysis is the original site of the disease, the incision is planned so as to expose it After separation of the periosteum the cortical bone overlying the affected metaphysis is perforated with a trephine or large burr, and from the opening so made a quantity of infected fluid escapes A series of openings is made along the line of the shaft at intervals of about three-quarters of an inch, and the openings are continued until red and apparently non-infected marrow is exposed The series is now converted into a common opening by removing the intervening segments of bone with a chisel We make it a rule never to interfere with the underlying marrow One often feels tempted to curette it with a sharp spoon but I am convinced that this is a mistake for it disseminates the infection and increases the degree or necrosis in the cortex of the bone We have found that treatment of the infected marrow by the Carrel-Dakin method is a most excellent procedure The wound is left open throughout its length a number of perforated capillary tubes are passed into the interior of the infected medullary cavity, and through these an intermittent irrigation with eusol or Carrel-Dakin solution is arranged At the end of a variable period (usually about three weeks) the disinfection of the interior is such that partial closure of the wound by secondary suture can be attempted We have occasionally applied the method of microbic count in estimating the time at which

secondary suture can be carried out, but I cannot say that we have found the method of any real value

The Method of Resection of the Affected Bone.—From a theoretical point of view there is something attractive about the idea that one should subperiosteally resect in its entirety the affected segment of bone. It would seem that one might thereby remove at any rate the bulk of the infection, and that, as there would be comparatively little opportunity for necrosis to occur, the period of the illness would be materially shortened. The idea has been put in active practice, and it is the method which some surgeons at present employ. We have tried the resection operation, but we have abandoned it. In our hands at least it presented serious disadvantages. We found that the local infection was not materially affected, in fact, in several cases we had evidence that it was actually disseminated, that the epiphysis became infected, and that the cut end of the bone was attacked by the disease. In one or two cases we believed that a general blood infection was induced by the manœuvre, and in more than one instance we had the unpleasant experience of finding that the regeneration of subperiosteal bone, upon which the success of the method essentially depends, failed to develop. We have therefore abandoned the method except under one condition—when there has been such an extensive infection, both subperiosteally and in the medulla, that the complete diaphysis is a sequestrum. In this event we practise the operation of diaphysectomy, because the bone is already necrotic from epiphysis to epiphysis.

The Treatment of the General Condition

This is a most important division of the treatment, and I have the feeling that in the past we have given it less attention than it deserves. The child who develops osteomyelitis must have been to some extent the subject of a septicæmia, and subsequent to the local infection a further degree of blood infection inevitably occurs. Therefore in every case of osteomyelitis consideration must be given to the treatment of the general infection. The lines which we follow in attempting to counteract the septicæmia may be grouped under the headings of vaccines, serums, special drugs, blood transfusion, and leucogenic stimulants.

Vaccines.—It is a rule in our practice that as soon as a case of osteomyelitis of the ordinary staphylococcal type comes under observation vaccine treatment is begun. Until an autogenous vaccine is available, which will be in four or five days, a stock staphylococcal vaccine is used. An initial dose of 200 million is given, on the third day a dose of 400 million is used, and this is repeated on the fifth day, thereafter the autogenous vaccine is brought into use, and it is given every fourth or fifth day. As far as possible an attempt is made to arrange that the vaccine is given at the lowest points of the pulse and temperature curves. The only exception which we recognize to this routine of vaccine treatment is the intensely acute septicæmic variety of the disease, in this class of case remedies which give a more immediate response are required.

Serums.—In the especially acute septicæmic type of case and in the case which has not responded to vaccine treatment we recommend and employ serum therapy. After a preliminary sensitization test we administer large doses of either a stock serum, a specially immunized serum, or, if neither of these is available, the ordinary horse serum. The drug is given daily in increasing doses, beginning with 10 c.cm. and reaching 100 c.cm.

Blood Transfusion.—The conditions which call for serum treatment we consider equally suitable for blood transfusion, and in young children particularly we favour this method. The value of blood transfusion in this connexion is enhanced if it is modified by the combination of exsanguination with the transfusion. The most striking demonstration of the value of the method is seen in those cases of osteomyelitic septicæmia which persist in spite of the ordinary lines of treatment.

Special Drugs.—You are probably aware of the recent experimental work which has shown the specific antibacterial influence of certain metals, particularly tin and manganese, upon the staphylococcal group. It is becoming a routine measure to employ these drugs, chiefly in their colloidal forms, in the treatment of acute osteomyelitis. We have accepted the routine in our work.

Leucogenic Stimulants.—I believe it was Professor Foucault who first advised the use of yeast and nucleic acid in osteomyelitis, because of the stimulating effect which these substances possess upon the white cell count. We have not employed this method of treatment, and therefore I can pass no comment upon it, but, in view of the seriousness of the septicæmic picture in osteomyelitis, it would seem to be worthy of a trial.

I would like to have said something of the local considerations of acute osteomyelitis, as shown in the iliac bone, the trigone of the femur, and the skull, but already I have overstepped by a large measure the amount of time and space which has been allotted to me; perhaps others will deal with these most interesting aspects of the problem.

GENERAL DISCUSSION

Mr. B. C. MAYBURY (London) congratulated Mr. Fraser on his opening paper. He had covered a wide field and had put many new ideas before them. Mr. Fraser had referred to acute osteomyelitis as a septicæmia, and Mr. Maybury dealt with this aspect of the disease—namely, acute osteomyelitis considered as a general systemic infection with local bone lesions.

In the very early stage of acute osteomyelitis it was not uncommon to find very transient local pain and tenderness in several of the bones. As a rule the pain and tenderness rapidly disappeared from all except the one bone which was affected with osteomyelitis. Cases which exhibited these features were most likely to be mistaken for cases of acute rheumatism. Fraenkel had pointed out many years ago that micro-organisms, either those which caused the primary disease or those which were responsible for a secondary infection, were frequently found in the marrow of the vertebræ, and less commonly of the ribs, of patients who had died from diseases such as erysipelas, pneumonia, diphtheria, general peritonitis, scarlet fever, etc. He had also indicated that the definite histological changes in the marrow showed that the entry of the organisms must have occurred during life and not *post mortem*. Inasmuch as the organisms in acute osteomyelitis must be conveyed to the bone by the blood stream from some primary focus such as a patch of impetigo, a septic cut, a carious tooth, or an infected tonsil, etc., it was a fair assumption that these early transient pains were due to a blood-borne infection of the bone marrow in many parts of the body, but that, before suppuration could occur, the infection was overcome by the patient's natural powers of resistance. If the infection in any given bone or bones was too severe, or if the patient's general or local resistance was too weak, the latter being often lowered by some apparently trivial trauma, then an acute osteomyelitis occurred. This afforded an explanation of those comparatively uncommon cases of multiple osteomyelitis in which two or more bones or ends of bones were affected simultaneously with the disease.

A generalized blood infection was thus an essential part of acute osteomyelitis, and the severity of the former bore a relationship to that of the latter. In very mild cases the clinical manifestations of the local bone lesion were slight, while those of the general infection were frequently overlooked or diagnosed as growing pains, influenza, etc. In very severe cases often the patient died from the general infection before the local bone lesion manifested itself clinically. While the common conception was undoubtedly true in certain instances that pyæmia was secondary to the osteomyelitis, it was much more probable that the osteomyelitis was simply a local "fixation abscess" occurring in the course of a general septicæmia or pyæmia. Thus, however early local operative treatment was undertaken in a fulminating case, it could have little effect on the course of the general systemic infection, and the mortality, therefore, always remained high.

To explain the occurrence of subacute, chronic, or

recurring osteomyelitis in which constitutional symptoms were absent or slight was not difficult. They knew that organisms might remain dormant in the tissues for a very long time, and it was probable that an attack of osteomyelitis of a subacute or chronic type was due to the awakening into activity of bacteria that had remained for months or years in a quiet state in the marrow, to which they had been conveyed by the blood stream at some previous date during the course of some undiagnosed febrile attack. The best example of this was the typhoid bone abscess. It was possible that the lodgement of bacteria in the marrow was of much more frequent occurrence than was supposed, and that it was only when the body failed to deal with the infection that osteomyelitis occurred.

A sign which might be of considerable value in the diagnosis of the disease was the delay in appreciation by the patient of tenderness produced by pressure on the shaft of the affected bone. If firm, steady pressure was applied to a part of the shaft which was free from swelling and remote from the spot of greatest tenderness, the patient would cry out with pain but only after the lapse of an appreciable interval of time.

The local treatment of a typical case of acute osteomyelitis was undoubtedly operation. But in many of the sometimes undiagnosed mild cases, in which there was little local pain and only slight fever, operative treatment was not necessary. Acute pyogenic infection of any tissue in the body might be suppurative or non-suppurative; the dividing line was not clearly defined, and depended upon the presence or absence of pus visible to the naked eye. For the former condition they operated, the latter they watched, and frequently the process subsided. A patient whose general condition was good, whose temperature was 99° to 100°, and who had some pain and a local tender spot, might be considered to have a mild infection. Such a patient should be treated by rest and heat applied locally. Frequently in twenty-four or forty-eight hours the symptoms would abate, the indications for operation were increased or, or persisting, pain and fever. Sometimes after amelioration of the symptoms recrudescence took place from time to time and pointed to the existence of a local bone abscess.

To summarize, acute osteomyelitis was a disease in which there was a general systemic infection with a local manifestation in one or more of the bones, it was comparable to pneumonia in which the lung was, as a rule, the site of the local lesion. It was capable of undergoing spontaneous abortion or cure. For a severe infection operation on the local lesion was urgently called for, but the treatment of the general septicaemia must not be ignored, for a mild infection expectant treatment should be adopted.

[Slides were shown of skiagrams of a humerus from a case of multiple osteomyelitis which demonstrated the formation of a Brodie's abscess from its earliest stage. The case, which illustrated certain of the above mentioned points, was that of a boy aged 15, who was admitted to hospital with a six days' history of acute osteomyelitis of the twelfth dorsal vertebra and upper part of the femur, he was also suffering from furunculosis. Symptoms of disease in the humerus appeared ten days after the onset of the illness. All three foci were treated expectantly, and all the symptoms subsided without operative treatment. At the present time, eight months later, the boy is quite well. He has had no recurrence of symptoms referable to the vertebral focus but has had two attacks of pain in the femur with slight fever lasting a few days, and occasional pain in the humerus. The skiagram of the femur showed a moderate degree of periosteal thickening and that of the humerus a central bone abscess.]

MR VICTOR DAVIS (London) said that his main point of disagreement was on the subject of operation since he was strongly in favour of subperiosteal resection of the shaft. He had collected a series of cases operated on at St Bartholomew's Hospital during the years 1909-13 inclusive and 1921-22-23. A total of 45 cases was operated on by gutter, the mortality being 17. In the cripple schools in London there were 77 cases of osteomyelitis, 15 amputations, and 13 with open sinuses. The results of diaphysectomy were better. In 7 cases of his own the mortality was 1 in 7 cases at St Bartholomew's Hospital the mortality was also 1. [Some charts were shown indicating the fall of pulse and temperature and a series of skiagrams illustrating the regeneration of bone.] He preferred diaphysectomy because of its rapidity, completeness, and absence of subsequent excavation of the bone. The main objection was failure of alignment but immediate attention was paid to extension that should be avoided.

MR A. MITCHELL (Aberdeen) was glad that Mr Fraser had drawn attention to two elementary but important points—namely that the disease always began at the end of the diaphysis, and that a simple periosteal abscess was practically never met with. He wished to confine his remarks to the question of treatment. From what he had seen of the work of others and from his own cases the results of the type of operation advocated by Mr Fraser had not in many cases impressed him very favourably and had led him to employ the method of subperiosteal resection to a much greater extent than he thought Mr Fraser did. He was well aware that this method had many critics but he ventured to think that some of its bad results had been due to too much being expected from it in bad cases and to insufficient attention to the details of after-treatment in suitable cases. It had to be admitted that simple drainage, by removal or a piece of bone cortex had often resulted in apparently insufficient removal of infection, fresh necrosis with repeated removal of equestra followed with persistent infection of the soft tissues, and fixation of joints or severe secondary haemorrhage might take place. In some cases amputation might have to be resorted to after many weeks of suffering on the part of the patient. By subperiosteal resection of the whole thickness of the affected bone one did much to avoid the sequelae and to ensure an easier convalescence. He had seen only one case in a child in which absolutely no regeneration took place, the periosteum had evidently been completely destroyed. This case would almost surely have resulted in amputation if treated by conservative methods, but by resection and subsequent grafting a fairly good leg was obtained. Mr Fraser had said that subperiosteal resection might be followed by increased signs of septicaemia and by death, and so might limited removal of bone; there were some cases in which the patient's condition was so grave that no local treatment could possibly help him. While he advocated resection in certain cases, neither he nor any advocate of resection, so far as he knew, had suggested that as a universal treatment. It was a little difficult to put on paper a description of the case suited for resection but he thought the cases seen in practice might be divided into three groups:

1. Manifestly mild cases where the general condition was good although the local condition had been present for an unusually long time, where the swelling was limited to the end of the bone and was not spreading. Here drilling the bone was usually sufficient.

2. Certain cases seen very early where although the pulse and temperature were high there was no swelling but only very severe tenderness strictly localized to one part. The periosteum was usually not much elevated but was readily separable over a small area only. Local operation was satisfactory if done early.

3. Most cases of acute osteomyelitis sent to hospital had a history of a few days' illness. There was abundant pus of local infection and pus was found under the periosteum, which was extensively separated. This was the commonest type and in it he had found that resection gave the best results. The shaft of the bone was divided by a Gigli saw, and only that part where the periosteum was firmly adherent was left in place. Usually in the tibia one removed the whole shaft.

He thought by this plan that the infection was more likely to be cut short. The bone removed was no likely to play a very important part in regeneration. Its presence would not help the periosteum which had been separated

from it and had adherent to its under surface osteogenetic cells, which were ready to produce new bone After removal of the bone the cavity was packed with gauze and the limb extended in a Thomas splint In two or three days the pack was removed and suture of the periosteum and of the skin was performed, combined with the insertion of tubes for Carrel-Dakin treatment The limb was kept in extension, but, at the same time, the patient was taught to perform voluntary contraction of the muscles at regular intervals, this was very important in stimulating the formation of new bone Extension and voluntary movement were persisted in until firm bone had been formed When the patient first began to walk a walking calliper splint was employed to prevent undue strain

The after-treatment of these cases demanded a good deal of care, but the results were well worth it It was often said that this method resulted in a great deal of shortening He had found that this was, if anything, less than after incomplete operation In support of this he might mention that he had recently seen a case which over six years ago had had resection of the lower half of one femur performed At the same time a trephine operation was done on the lower end of the other, which was now over one inch shorter than the side on which the resection was done As to general treatment, he had found both serums and vaccines helpful, but he had not yet seen any lasting good from blood transfusion in severe septic cases His experience of this had not been extensive and had, perhaps, been unfortunate

[Lantern slides and photographs were shown illustrating the various stages of regeneration of bone in children and the possibility of reconstruction by bone-grafting in adults]

Mr F J S HEANEY (Liverpool) had had within the previous two months examples of most of the varieties of osteomyelitis already mentioned, including one fatal case of staphylococcal osteomyelitis of the upper end of the humerus—a fulminating case with acute pleurisy which indicated a general infection He had also had four cases of osteomyelitis which came after suffering for a week In all of them the whole thickness of the tibia and a good part of its length were affected, and in all the indication for subperiosteal resection was clear In these cases the patient had in the course of a week, and by his own vaccines, overcome the general infection, and the relief of the local condition was immediate his experience was that the ultimate results were good In one case—a Brodie's abscess with acute extension to the soft parts—he drained and trephined, when the shell of the humerus had become thick enough so that one side of it could bear the weight of the limb, then gathering and muscle-grafting were performed Under his care at that moment was a case of multiple mild osteomyelitic lesion, which he hoped would clear up under treatment by an autogenous vaccine

Professor G E GASK (London) congratulated Mr Fraser on his paper He agreed that the disease was the result of a generalized infection, the infecting organism entering by some lesion the nature of which varied considerably He wished that the old nomenclature, so confusing to students, might express more clearly the pathology As regards treatment, he said that he had never performed subperiosteal resection, and he concluded after listening and studying the results, that the most important thing was the individual care of the surgeon

Mr C JOLL (London) did not feel satisfied that Mr Fraser and Mr Maybury had made out a case for non-operative treatment of certain mild cases (especially pneumococcal), but rather that such cases would do well with very limited operation He pointed out that in the case treated by expectant methods referred to by Mr Maybury the patient still had a chronic abscess of the humerus after eight months' illness, and that had operative treatment been carried out at an early stage the result could hardly have been less favourable Mr Joll also criticized Mr Acton Davis's and Mr Mitchell's operation of sequestrectomy on the ground that in the skiagrams shown the resection did not include that portion of the bone—namely, the metaphysis—which was generally admitted to be the site of the primary infective process

Mr GILES TURNER (Newcastle-upon-Tyne) drew attention to the persistence of infection and its recrudescence often after many years in those cases of bone disease, and suggested that one of the important problems was the possible effect of the primary method of treatment on the ultimate after-history It had been his misfortune to see some of the bad results of removal of the whole diaphysis, but he was greatly impressed by what had been said concerning it by the previous speakers, and especially by the cases so ably demonstrated by Mr Mitchell Shortening of the convalescence seemed to be one of the great points in its favour He himself thought that there was a great deal in what Professor Gask had said concerning the individual attention given to this class of case, and he agreed that it was probable that just as good results would be secured by the older methods if as much attention were paid to all the details connected with them treatment as was devoted to the newer methods

Mr ERNEST FINCH (Sheffield) said that in the diagnosis of acute osteomyelitis in the early stages too much stress must not be laid on the early findings In these early stages, and it might be in the most acute stage, there was no change in the skiagrams of the bone The consequence of this was that treatment of the bone condition was often delayed until some outstanding complication had developed Treatment must be begun as soon as the clinical signs indicated that the bone was affected The treatment by diaphysectomy was not any more successful than the gutter operation In the latter operation it was rare to have to remove any sequestrum if the operation was thoroughly done It might be that there were some small superficial flakes of bone exfoliated, but there was, as a general rule, no large mass of dead bone to be removed In the adult, diaphysectomy might give rise to great trouble in the after-treatment, new bone did not form, and bone-grafting would have to be done Bone-grafting into a septic cavity might be most difficult and the time spent in the after-treatment would be longer than after the gutter operation

Mr T JASON WOOD (Bradford) reported a virulent fatal case of staphylococcal infection proceeding apparently from an ordinary boil which had disappeared at the time of operation Two cases were cited of elderly men, aged between 65 and 70, who developed acute septic arthritis of the knee as the result of persistent osteomyelitis contracted in childhood

Mr LIPSCOMB (Sydney) remarked that the disease was of less frequent occurrence in Australia than in Great Britain, this might be due to the warmer climate and the fact that the general resistance of the people was greater He insisted that early interference in acute bone conditions would in most cases clear up the disease, and that only in few cases would the condition progress and necessitate more drastic surgical interference The infection was generally staphylococcal, since the staphylococcus was essentially a skin organism The lessened occurrence of the disease in Australia might perhaps be due to the fact that in warmer climates swimming and bathing were indulged in much more freely than in colder climates

Sir CUTHBERT WALLACE (President of the Section) said that osteomyelitis was a dirt disease and was seldom seen among those in whom personal cleanliness was easy It was a disease that was getting rarer and milder For the proper treatment one must determine whether the disease was really a septicaemia with local manifestations or primarily a local disease that became systemic As regards operation, it should be confined to the more marked cases, the milder local lesions were capable of curing themselves

SURGICAL TREATMENT IN AURICULAR FIBRILLATION OCCURRING IN TOXIC GOITRE

(*With Special Plate*)

BY

T. P. DUNHILL, C.M.G., M.D.

Assistant Director Surgical Professorial Unit and Assistant Surgeon to St. Bartholomew's Hospital

THIS paper is complementary to a paper read by my colleague Professor Fraser at the annual meeting of the Association of Physicians in 1923 and published in the *Quarterly Journal of Medicine*, July, 1924, which dealt with the physiological and pharmacological aspects of the subject drawn from cases under our care.

Between 1907 and 1919, among cases of exophthalmic goitre operated upon by me there were a number who had irregular heart action. I had reason to believe that hyperthyroidism (feeling of heat, restlessness, tremor) was present, and on that account the condition was being aggravated, and therefore it seemed rational to prevent further visceral damage by reducing the amount of the secreting gland. Cases of this type were reported by me in various publications from 1907 to 1917. The degree of improvement varied. Some were more comfortable, some were able to return to work after having been bedridden.[1]

In 1917 a man (Case 1) greatly emaciated with rapid irregular heart action previously regarded as suffering from sprue was seen by Sir Hector (then Dr.) Mackenzie and correctly diagnosed by him as a case of exophthalmic goitre. Subsequent to partial thyroidectomy his heart became regular.

In 1919 in Australia I saw a patient (Case 2) with irregular heart action. In this patient the goitre was an adenoma completely intrathoracic. After this was enucleated the heart became and has remained regular.

Up to this time it had not been possible for me to have basal metabolic rates measured, nor electrocardiographic record made so that I had to judge by clinical evidence whether hyperthyroidism was still present and damage still being wrought; no permanent records of the auricular fibrillation were made. Also the pathology of the resected gland tissue was not completely recorded. Subsequently, working with the professorial unit at St. Bartholomew's Hospital it became possible to have graphic records made of such cases and the sequence of events established. The pathology could also be studied.

The first case after this time was a woman (Case 3) who had been under medical treatment by one of my colleagues. There was a two-months' history of serious illness. She had oedema of the legs. There was a loud systolic murmur at the apex.

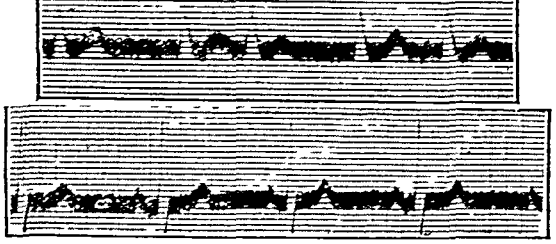

FIG. 1.—Case 3. The upper tracing shows auricular fibrillation. The lower one normal rhythm.

The pulse was irregular in force and frequency. On September 27th, 1920, the right lobe and isthmus of the thyroid gland were removed under local anaesthesia. Three weeks later two thirds of the left lobe were removed. She went to a convalescent home and on her return visited the hospital to show herself. Her pulse rate was 72 and the rhythm regular. In this case the heart became regular spontaneously without other aid than the removal of sufficient of the toxic cause and has remained so. There is no oedema. The woman is working hard. She manages swimming baths in the summer in addition to doing her household work.

(Electrocardiogram before and after operation and photomicrograph of gland shown. No. 3.)

During this time Professor Fraser had been working at the problem of auricular fibrillation and we had been together such cases as came into our respective wards. In the next patient surgical and medical co-operation was required to cause the return of the heart action to normal rhythm.

A naval rating (Case 4) had been sent to me to St. Bartholomew's Hospital from Sydney in 1922 after the right lobe of his thyroid had been removed there. He had had exophthalmic goitre for five years. The pulse had been irregular for at least two years. Being a sailor he was sent by the Ministry of Pensions to the Heart Hospital on arrival in England where he came under the care of Dr. Strickland Goodall. Electrocardiographic records were taken, and he was finally transferred to me. Two thirds of his remaining lobe were removed under local anaesthesia. His heart did not become spontaneously regular but after four doses of quinidine sulphate (5 grains each) the heart became regular and there has been no auricular fibrillation since.

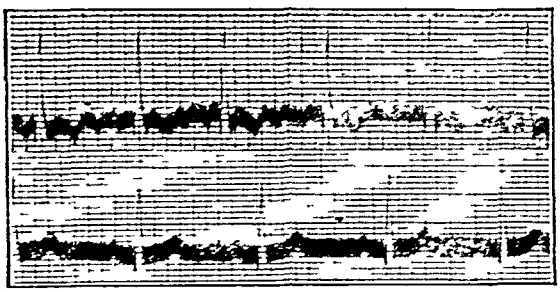

FIG. 2.—Case 4. The upper tracing shows auricular fibrillation. The lower one normal rhythm.

(Tracings, basal metabolic rate, and pathological sections shown. No. 4.)

The next two cases of auricular fibrillation became regular spontaneously after a sufficiency of the thyroid gland had been removed. They differed strikingly in several ways.

One (Case 5) was a typical case of exophthalmic goitre—a woman about 29, who had tremors and characteristic eyesigns but also with a systolic blood pressure of 200. She was watched for a month before operation could be risked. Removal of one lobe made no difference to the fibrillation and she remained very ill. After removal of two thirds of the second lobe (June, 1922) the heart became regular and has remained regular. This woman is very active and states that she walks six miles at a time. Both operations were performed under local anaesthesia.

(Photomicrograph of gland shown. No. 5.)

The other case (Case 6) had been ill for a long time. Eight years before the time when I saw her with Sir Hector Mackenzie she had been in bed for six weeks on account of her heart symptoms. She had not improved during those eight years. Two years before her operation her feet and legs had become oedematous while she was in bed. When I saw her in 1922 her heart was fast and very irregular; her face and legs were swollen and she had been in bed for eight weeks. The thyroid gland was very large and symmetrical but she had not quite the look of a case of Graves's disease in that there was not the usual mental restlessness. A venous pulse was visible in the neck, and distended veins were present over the chest. In this case the absence of mental restlessness made it safe to remove all of one lobe and two thirds of the other at one operation under local anaesthesia. It was six months before the irregularity completely disappeared. The pulse has remained regular (rate 72 to 84) for the last two years and the oedema has disappeared.

Of the next two cases the goitre in one (Case 7) consisted of multiple adenomata. He had had goitre all his life. His heart had long been irregular. It became regular spontaneously after removal of most of the goitre in March, 1922, but fibrillated for a short time two months afterwards. He was given a few doses of quinidine in Edinburgh and his heart has remained regular for two years subsequently. Part of the goitre was so deep in the thorax that a lower extremity could not be reached by the forefinger. It was gradually drawn up by a finger on each side of it

The other one (Case 8), aged 49, was an extremely bad case of exophthalmic goitre I believe his heart had fibrillated for eight years The rate was uncountable on account of its rapidity and its irregularity Removal of the first lobe made no difference After removal of two thirds of the second lobe in January, 1923, he was given quinidine On the tenth day

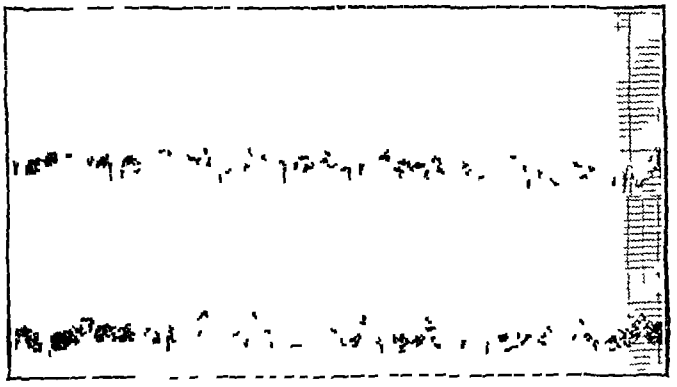

Fig 3—Case 8 The upper tracing shows auricular fibrillation The lower one normal rhythm

after this the heart became regular Possibly the length of time during which his heart had fibrillated accounted for the amount of quinidine required In this case premature contractions now occur, but no auricular fibrillation

(Electrocardiogram before and after operation, and photomicrograph of gland, shown No 8)

In two cases of true Graves's disease (Cases 9 and 10) with auricular fibrillation the heart's action has become regular spontaneously after removal of one lobe and two thirds of the second lobe of the thyroid gland (without administration of quinidine) In Case 10 the heart became regular after ligation of the superior thyroid arteries Auricular fibrillation recurred on exertion It disappeared after a sufficient partial thyroidectomy

(S H Electrocardiogram before and after operation, and photomicrograph of gland, shown No 10)

There are two patients (Cases 11 and 12) in whom I have removed only one lobe, and in neither of these has the heart become regular In one case the heart can be held regular with quinidine, but under stress it fibrillates again The other one, a comparatively young man, has had no quinidine, but his heart could I feel sure be made regular by the removal of two thirds of the remaining lobe He feels well enough to do the work he wants to do in his present condition The photomicrographs (Nos 11 and 12) show how active the glands are in each of these two cases It is not reasonable to expect that the fibrillation will stop while so much extremely active gland remains

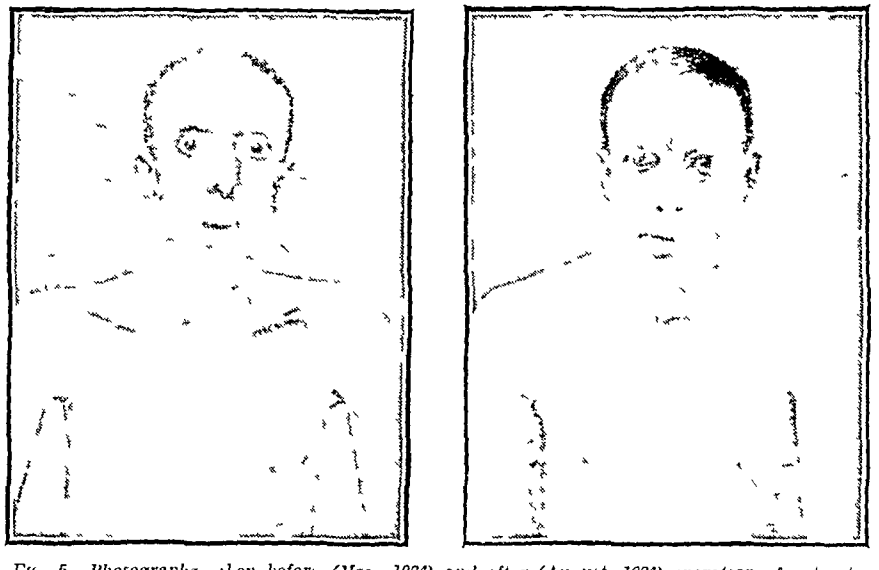

Fig 5—Photographs taken before (May 1924) and after (August, 1924) operation of patient No 15 in the appended table

One patient has died, possibly as the result of the administration of quinidine, though this is doubtful The electrocardiogram showed that it was not a pure case of auricular fibrillation, some degree of heart-block being also present, and quinidine was being given tentatively One patient —*very ill—died subsequent to operation She was too ill* a person to have been operated upon

Patients are not infrequently seen who have auricular fibrillation associated with goitre, but in *whom the goitre* is not the cause of the auricular fibrillation It is necessary to be alert to this type of case A diastolic murmur or a history of rheumatic fever may put one on guard, and the condition is not just that of a thyrotoxic person On the other hand, there are many cases in which it is obvious that thyroid toxæmia is present The rapidity of the pulse rate, the moist heat of the skin, the staring, restless eyes, show a hyperactive condition of the thyroid This can be confirmed by taking the basal metabolic rate Further subsequent proof of the activity of the thyroid is given by

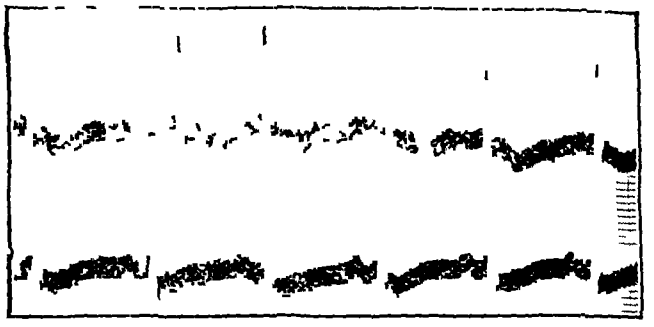

Fig 4—Case 10 The upper tracing shows auricular fibrillation The lower one normal rhythm

the microscopical examination of the gland, and the final evidence of the goitre factor, for the patient, is the disappearance of the auricular fibrillation One patient, whose fibrillation had lasted for at least several years, writes "Words cannot give any adequate idea of the quiet peacefulness that has replaced the restless breathless efforts of the last few years"

Since writing the above the *Medical Journal of Australia for March 1st, 1924, has come to hand, in which* Turnbull makes the statement that in two cases operated upon by me before I left Australia, auricular fibrillation, which was present before operation and still evident three weeks later, *had* disappeared when the patient returned after three months

The photographs (Fig 5) show the difference in the appearance of the individual before and after the operation

The microphotographs repay careful study At a first glance, huge spaces are seen filled with colloid —often *with flat*tened epithelium (See No 10, to the right of the middle of the field) It might be said that they are not pictures of exophthalmic goitre at all, but it is to be remembered that these patients have been ill with Graves's disease a long time, and that the gland has gone through the pathological stages so well described by Marine,[2] but there are seen to be in all of them areas of *extreme activity and high columnar epithelium* It is the secretion from these areas which is damaging the heart

Summary

Auricular fibrillation is one not infrequent result of thyroid toxæmia It may result from toxic adenoma or from Graves's disease

In toxic adenoma it may disappear when the *adenoma* or adenomatous masses have been removed

In Graves's disease it may disappear temporarily when vessels are ligated, or when one lobe has been removed When it has done so, in our experience, it has recurred under stress When sufficient of the second lobe has been

No 10—Mr H Diseases duration eight months Electrocardiographic records complete Localised papilliferous formation with columnar epithelium × 400

No 17—Miss P Goitre fifteen years, heart irregular for seven years Electrocardiographic record × 66

No 9—Mr C W Graves's disease fifteen years fibrillation eight years Electrocardiographic records complete Columnar epithelium × 400

No 13—Miss G U × 400

No 4—Mr R Graves's disease five years fibrillation two years Electrocardiographic records complete

No 12—Miss G Graves's disease seven years Operation two attempt incomplete (only one lobe removed) Note high columnar epithelium × 400

No 5—Miss S Electrocardiographic records complete Note high columnar epithelium × 72

No 11—Mrs A One lobe only removed Extremely active heart, still fibrillating × 66

Fig. A

Fig. B

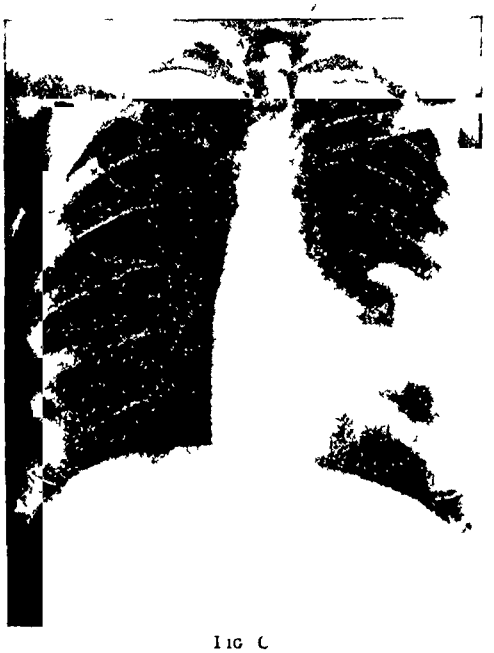

Fig. C

Fig. L

Fig. E

removed it may disappear spontaneously and permanently, or it may require the administration of some quinidine before this occurs

When one lobe alone has been removed in a case of Graves's disease, quinidine has not been capable of holding the heart regular

In two cases in which auricular fibrillation has disappeared occasional premature contractions occur

The dangers of quinidine must be appreciated before it is given In this series the administration of quinidine has been controlled by Professor Fraser

The causation of Graves's disease, or its treatment, does not come within the scope of this paper It is a record of our experience in dealing with one late manifestation

I am indebted to Dr Arnold Stott and Dr Strickland Goodall for the electrocardiographic records, and to Mr G L Keynes and Miss Vaughan, of the Surgical Professorial Unit of St Bartholomew's Hospital, for the photomicrographs

Case No.	Age	Length of History of Disease	Electrocardiographic Records	Basal Metabolic Rate: Before	Basal Metabolic Rate: After	Amount Removed	Auricular Fibrillation Disappeared: Spontaneously	Auricular Fibrillation Disappeared: With Quinidine
1	—	2 yrs	—	—	—	1½ lobes	Yes	—
2	—	Some years	—	—	—	Adenoma	Yes	—
3	45	1 yr	Yes	—	—	1½ lobes	Yes	—

17	43	15 yrs	Yes	—	—	1¾ lobes	Yes	—
18	This patient died							

Note.—All the cases were of the type of Graves's disease and 7 were of the multiple toxic adenoma type. Case 7 had recurrent contractions and 8 have now (3 is the patient who died three months later and one other case (*vide supra*) died after operation.

PERIPHERY

[1] BRITISH MEDICAL JOURNAL, May 22nd 1920. *Cleveland Medical Journal*, March 1923.

DISCUSSION

Mr C A JOLL (London) pointed out that Dr Strickland Goodall, working with clinical material provided by Mr Joll, had shown that auricular fibrillation was the commonest cause of irregularity of the heart in Graves's disease, and occurred in approximately 10 per cent of cases Dr Goodall had taken electrocardiographic records of all cases before and after operation and while in a considerable percentage the auricular fibrillation rapidly cleared up after the operation in a small number auricular fibrillation was actually developed after operation in patients previously free from that condition, and might be fatal He added a warning not to expect to cure invariably auricular fibrillation in Graves's disease by operation

Mr DUNHILL, in reply said that Mr Joll had stated that it was rather optimistic to claim that 100 per cent cases of old standing auricular fibrillation recovered normal rhythm after operation and that the experience of other operators did not quite bear out the statement The claim was not made that 100 per cent recovered Two in this series, for one reason or another, had died, and in two others—due to insufficient removal of gland—the heart still was fibrillating These two possibly supplied the answer to Mr Joll's statement Mr Dunhill believed that when two-thirds of the remaining lobe had been removed the rhythm would become normal for it was true that in all the other cases (fourteen in number) the auricular fibrillation, old-standing in every case had disappeared These cases and their records were available for examination

BLOOD DONORS

BY

GEOFFREY KEYNES, F R C S ENG,
First Assistant Surgical Professorial Unit St Bartholomew's Hospital

BLOOD transfusion has now become a more or less standardized procedure Many practitioners are familiar with the technique, and the operation can usually be carried out with some degree of precision both as regards method and results On these points there is not much that is new to be said This short communication will deal therefore with a side of the problem which is usually not sufficiently considered—namely, the question of how to obtain a supply of blood when and where it is needed The performance of a blood transfusion postulates the presence of at least one willing and suitable blood donor and in hospital practice at any rate the provision of this important individual is too often left to Providence—a source of supply which is notoriously uncertain in its operations This prevailing uncertainty as to how or where to obtain a blood donor often results in the postponement of the decision to transfuse until the patient has passed from the category of hopeful to that of hopeless prognosis and the operation is in the end forestalled by death This position was recently illustrated in a very tragic manner which was exploited by the daily press to its full extent A member of our own profession was at death's door with typhoid fever, and as a last hope a request for a volunteer as blood donor was broadcasted by wireless A number of generous individuals who had recently recovered from typhoid, of course, responded only to be told that the patient had already passed beyond the reach of aid Better organization might have avoided the publicity, though the problem was not a usual one The time when a transfusion carried out in civilian practice was matter for a sensational headline in the newspaper has now almost passed, but there still lingers a popular disposition to regard a blood donor as a "hero" who has endangered his own life to save that of another It should now be widely known however, that acting as a blood donor does not entail any suffering, and only a very temporary disability Extensive experience has taught me that a healthy young man can part with 750 c.cm. of blood or even more without any immediate effect, such as faintness, and that after a short rest he can perform an ordinary day's work as efficiently as if nothing had happened If fainting does occur, it bears a direct relation to the psychological state of the donor at the time If he approach the operation without apprehension there will be no ill effects If on the other hand, the donor be imbued with a conscious heroism a painful or unpleasant process is anticipated fear and faintness are then the natural consequences Against this may be set the fact that several donors have told me a few days after giving blood, that they felt definitely better and more vigorous after than before the operation Nobody supposes that phlebotomy, so extensively practised by our forefathers was based entirely on superstition An American writer has shown that a large proportion of blood donors experience not only a feeling of well-being but also an increase in weight after the operation It has also been found that a loss of 500 c.cm. of blood can be made good in less than a week

In considering how donors are to be obtained it is necessary to be clear as to what kind of individual is most suitable for the purpose

1 *Sex*.—In the first place men are more suitable than women Equanimity, as already explained, is an important asset in a donor Large and readily accessible veins such as are more often found in men than in women are also of considerable importance A case of subcutaneous

fat may render the introduction of a large-bore needle into a vein a matter of some difficulty, and it is of the first importance that the drawing of the blood should be carried out with precision and without causing pain or injury to the donor It should never be necessary to expose and ligature the donor's vein It has also been shown that acting as donor is liable to produce in women a slight degree of anæmia This very seldom happens in men

2 *Age*—A donor should be young, but not too young Again, the psychological factor is affected by age Furthermore, a rapid and complete physiological accommodation should follow the withdrawal of circulating fluid, if after-effects are to be avoided The donor should therefore be not younger than 20, but not older than 40

3 *Health*—Emphasis need scarcely at this date be laid upon the necessity for employing a healthy donor Transfusion has on several recorded occasions been responsible for the transmission of syphilis, malaria, and even of measles If it is intended to use any given donor for more than one transfusion as occasion offers, it is an additional advantage for the operator to have some personal knowledge of the donor's circumstances and habits His Wassermann reaction must be tested before he is used for the first time, and, if a long interval elapse, it should perhaps be tested again before he is used a second time But personal acquaintance may make the repetition of the test unnecessary

4 *Blood Group*—As regards the blood group of a prospective donor, it has been customary to refer to individuals belonging to Group IV of Moss as "universal blood donors," on the supposition that the blood of a Group IV donor may be given to any and every recipient I believe this statement to be only an approximation to the truth, and I am sure that it is safer to give some patients the blood of their own group rather than that of Group IV This is especially important in treating blood diseases, such as pernicious anæmia, but I cannot discuss this in any detail at the present time The inference is that it is better to have donors of all groups available rather than members of Group IV only

In private practice I have not found it difficult to arrange for a regular supply of suitable individuals who will be ready to give their blood at any time in return for an adequate reward They soon become thoroughly accustomed to the procedure, and it is sometimes convenient to have a donor who can himself render active assistance when his blood has been taken I always have more donors of Group IV available than of other groups, as there will probably be no opportunity for selecting in an emergency, and these individuals are fortunately not difficult to find It is scarcely possible for a man to be a "professional donor" to the extent of making this his only means of livelihood, and it is likely to remain a part-time profession at the present market rate for blood It is, however, remarkable how frequently a healthy donor can part with blood without experiencing any ill effects It is recorded that one individual has given blood at an average interval of once in six weeks for a period of more than four years Another has given eleven donations in eight months, an average of one every three weeks

A more difficult problem is the organization of an adequate supply of blood donors for hospitals, and in discussing this I shall assume that no blood donor will receive any payment

Here, again, there will always be the two types of cases to be treated (1) the emergency, such as traumatic haemorrhage or severe haemorrhage from a gastric or duodenal ulcer, and (2) the medical case, such as pernicious anæmia, where the necessity for transfusion can be foreseen and arrangements made at leisure

I will take *in succession* the various possible sources of blood donors and indicate which appear to me to be the most suitable for general use

1 Relations of the patients may occasionally be used, but more often than not no suitable relation can be found, and sometimes they are unwilling It is now generally realized that consanguinity is no guarantee of compatibility of bloods, so that relations often have to be rejected on this ground alone Relations are very often *not available in an emergency*, so that this source of supply could not in any case be regarded as a source upon which dependence could be placed

2 Volunteers in the wards can often be found, and this is a source of supply which I have very frequently used in an emergency A young man, who has come into hospital for an operation for hernia or other condition which is unaccompanied by any constitutional disease, is usually willing to act as blood donor when it is made plain to him that his own recovery will not be in any way prejudiced, but that he may be instrumental thereby in saving someone else's life But, again, this source of supply is uncertain There may be no suitable patients, or suitable patients may be unwilling or may belong to the wrong blood group

3 "The unemployed" have been used at one metropolitan hospital, but clearly donors from this source cannot be expected to volunteer, and the question of payment lies somewhat outside the scope of this communication

4 The police force has been suggested as a source of supply, and has, I believe, been used for this purpose, but it is obviously impossible for a chief constable to permit his men to be taken off duty at any moment in order to supply blood when required The policeman's lot is said not to be a happy one, and it would be putting a rather severe strain on his already almost superhuman benevolence to expect him to give his blood to all who need it

5 Members of the nursing staff of a hospital or hospital attendants should certainly not be used as blood donors The hard work and exacting conditions of life in hospital are not productive of robust health, and the principle of using these individuals, when once established, would introduce a feeling of moral obligation to give blood, which must be carefully avoided

6 The use of medical students as donors is to be deprecated for the same reasons Students are used extensively in some American hospitals, but they are given a considerable sum of money whenever they do so, and volunteering is placed thereby on an entirely different basis Where a fee is accepted, the sense of moral obligation will not be induced

7 A properly organized supply of volunteer blood donors must therefore be found outside the hospital among healthy individuals who will not be subjected to any undue moral suasion I would suggest that the various organizations of Red Cross workers throughout the country may perhaps afford one of the best solutions of the problem These organizations consist of individuals of the highest character and of good physique, who are anxious to give personal service Their training also gives them some insight into surgical procedures, so that they will regard the operation of transfusion with equanimity If their interests are safeguarded by a careful preliminary examination and by a correct technique in performing transfusions, donors enough for the needs of all hospitals could probably be provided in this way

DISCUSSION

Mr H P WINSBURY WHITE (London) asked what Mr Keynes's technique was, and whether any alteration from the technique as practised *during the war had taken place*

Mr F J S HARNEY (Liverpool) said that in Liverpool a register was kept of blood donors, who were paid for their services and were available for neighbouring hospitals

Mr COLIN MACKENZIE (Bradford) said that Mr Keynes's paper was of great importance at the present juncture The system at *Bradford* was to keep a register of Group IV donors whose Wassermann reaction was negative, and to pay £10 for their blood Immuno-transfusion was likely to increase A case of septic gunshot wound of the knee-joint was successfully treated by him in France by a transfusion of blood from a donor previously vaccinated with a vaccine prepared from the knee-joint

Mr GEOFFREY KEYNES said that his communication was directed chiefly to the question of obtaining *unpaid* blood donors It was not difficult to obtain donors by advertising a reward of £5 or £10, but it was not so simple to obtain in this way individuals whose Wassermann reaction was

likely to remain permanently negative The authorities of many hospitals did not favour the idea of paying blood donors when it was brought up for discussion, and other arrangements had to be made With regard to technique, he thought that the method of using citrated blood gave the most certain results in general use The chief recent advance was the process of immuno-transfusion, introduced by Sir Almroth Wright and his co-workers, in which defibrinated blood was used The efficacy of this method for patients suffering from severe infections was still *sub judice* Other methods, such as the Kimpton Brown tube or multiple syringes were used with success by some operators, but these were less suitable for general use than citrated blood, which gave perfectly satisfactory results in all surgical cases No further advances of importance had yet been recorded

TWO PROBLEMS IN THE TREATMENT OF CLEFT PALATE

BY

FRANCIS WILLOUGHBY GOYDER MB FRCS,

Surgeon Bradford Royal Infirmary

(*a*) *The Problem of the Prominent Premaxillary Segment in Tripartite Palate*

THE beak-like protuberance of the intermaxillary segment in cases of complete double hare-lip and cleft palate is so pronounced and the strain put upon the sutured edges of the double hare-lip, by suture of both sides simultaneously, is so great that surgeons formerly removed the premaxilla, to abolish tension

The loss of the incisor teeth, and the tightness and flatness of the new upper lip, as compared with the lower, produced such deformity that removal of the premaxilla has been abandoned Wedge-shaped excision of part of the nasal septum, accompanied by pressing back the prominent premaxilla, facilitates suture of the lip, and is frequently practised This inevitably results in tilting of the incisor-bearing segment, and the upper incisors when they erupt will be directed backwards and when the mouth is closed, will lie behind the lower ones instead of just in front as they should

A sliding operation on the septum, though feasible and though allowing no malposition of the upper incisors in relation to the lower, means unnecessary and perhaps harmful interference with the vascular and nerve supply of the premaxillary segment

It is not necessary to close both sides of the lip simultaneously Closure of one side in the first few weeks of life and of the other about two months later, can be performed without undue tension on the suture lines This procedure results in normal relation of the upper to the lower incisor teeth owing to the backward pressure of the united lip Hence no operation on the central segment of the palate is required for in about two years' time the premaxillo-maxillary cleft is abolished on both sides, and the remainder of the cleft can be treated at the time judged most suitable

(*b*) *The Problem of Speech after Cleft Palate Operations*

In my experience good speech after operations for cleft palate is rare Closure of the cleft though difficult, is an easier problem to solve than is that of producing clear articulation

I firmly believe that the short soft palate almost inevitable with our recognized methods of closure, is the cause of our failures, and that progress will not be made until we recognize and deal with this difficulty

I think the cleft soft palate is too small at birth and that it is made still shorter by paring and suture Unless the newly formed palate is long enough to shut off at will, the nasal from the oral cavity, articulation must be defective except for the sounds *m n* and *ng* To make such closure possible the surgeon must diminish the gap between the posterior end of the soft palate and the posterior pharyngeal wall To do this he must either make a longer soft palate or increase the forward prominence of the posterior pharyngeal wall, or do both

The latter procedure has been advised and performed by Spitzy and Gratz, who injected paraffin A rat graft would be preferable, but as up to now it would be difficult Neither method appears likely to come into general use, and hence one's efforts must be directed towards making a soft palate of sufficient length This can be done only at the expense of the tissues of the hard palate If much hard palate has to be used to make good the deficiency in the soft, the gap in the hard palate cannot be closed by operation But, as Mr Gillies has shown, that defect can easily be made good by prosthetic apparatus

In short, to my mind, the adoption of methods based on the principles recently enunciated by Mr Gillies means a real prospect of improvement in our results as far as speech is concerned, the surgical triumph of complete closure of the palate is an empty one if the patient cannot speak clearly

DISCUSSION

Mr C A JOLL (London) agreed with Mr Goyder in deprecating the removal of the premaxilla, but favoured the paring down of the prominence with a sharp knife This, he claimed, enabled the double hare-lip to be closed in one stage as a rule—a point of importance since the cosmetic result was in his opinion, better when both sides of the lip could be dealt with together He had completed a series of 100 operations for cleft palate without a death by the Langenbeck or Smith method The result of the operation on the speech was not in Mr Joll's opinion so unsatisfactory as Mr Goyder suggested though, admittedly, perfect speech was not often achieved He was not sure whether Mr Gillies's method would really give improved speech as he had only practised it recently, but up to now he was not favourably impressed

X-RAY EXAMINATION IN RELATION TO SOME ASPECTS OF PULMONARY TUBERCULOSIS

BY

J H MATHEP, MB, ChB, DMRE,

HONORARY RADIOLOGIST ROYAL SOUTHERN HOSPITAL RADIOLOGIST ASSISTANT TO PENSIONS HOSPITAL KNOTTY ASH LIVERPOOL

(*With Special Plate*)

WHILE the value of the *x*-ray examination of the chest in cases of tuberculous or of suspected tuberculous disease of the lungs is now well recognized by the majority of clinicians scrutiny of the records of several thousand radiological examinations of the chest shows that the majority of the cases are sent to the *x*-ray department merely for confirmation of the clinical findings When the radiologist is able to confirm the clinical diagnosis of tubercle, the special value of the radiograph lies in the fact that he extent of the lesion is accurately delineated Prognosis may be markedly influenced by a knowledge of the exact position and extent of cavities and it is frequently possible to differentiate between the "woolly" mottling indicative of active disease and the characteristic appearance of the quiescent or healed lesion, showing fibrosis or calcification, or both

It is evident that the radiologist may thus be able to amend the diagnosis and influence the prognosis in cases already labelled positive Cases tentatively labelled negative and confirmed as such by *x* rays call for no comment

It is in the remaining portion of the cases under review that the radiologist's activities become more than supplementary to those of the clinician. Here the radiograph is of paramount importance Reference to some of the cases detailed below make it clear at once that an *x*-ray examination may be of such supreme value that a radiologist's report should be obtained wherever there is a shadow of doubt as to the presence of tubercle I shall endeavour to prove that this is essential in cases where the evidence gleaned from the physical examination of the chest is not sufficient to account for the symptoms

The group may be subdivided into five types, and I propose to describe these in the order of the frequency with which they appear in the *x*-ray department

Type I

In this type the *x*-ray picture is that of extensive mottling of both lungs, symmetrical in character, with restricted movement of both diaphragms Such cases may be sent to the department with the request "*x*-ray of chest for cause of pain below left clavicle," or "*x*-ray stomach and duodenum for suspected duodenal ulcer," no mention being made of suspected tuberculous disease of the lungs The following three cases are illustrative

Case I

A male, aged 27, was sent to the *x* ray department on November 15th, 1921, for *x* ray examination of stomach and duodenum for suspected duodenal ulcer The patient complained of pain in the stomach half an hour to an hour after food marked loss of weight, and slight cough and expectoration The family history was good He had always been healthy up to two years before examination when he commenced to have pain after food He had never vomited and the pain did not tend to become more severe He stated that he had been examined altogether by *over twenty doctors, the majority of whom had examined his* chest and told him that there was no evidence of disease He had been treated during these two years for duodenal ulcer (light diet, etc), but as he was gradually getting worse he was referred for *x* ray examination to confirm the diagnosis He was extremely emaciated and could only stand for a short period

On examination of the stomach and duodenum after the test meal nothing abnormal could be detected and it was evident that no sufficient lesion existed in this region to account for the patient's condition In the endeavour to find some cause for his cachexia a screen examination of the chest was made Extensive mottling of both lungs was seen symmetrical in character with restricted movement of both diaphragms The radiograph (Fig A) confirmed the screen findings, and the report was made that the *x* ray appearances of the chest were typical of extensive tuberculous disease of both lungs The sputum was then examined and found to be positive The *x* ray diagnosis was fully confirmed at the *post mortem* examination seven weeks later

Case II

A male aged 56, had always been a great athlete and had been in perfect health up to two years before being examined, when he had a severe attack of "influenza" and was in bed for several weeks On getting up he found he was very short of breath and could not play more than five or six holes at golf instead of his former thirty six His doctor repeatedly examined his chest, but could detect nothing abnormal Eighteen months after the "influenza" his voice became husky, and he was seen by an eminent physician, who told him his chest was as sound as a bell' He therefore consulted a laryngologist The latter found on laryngeal examination that there was double abductor paresis and that both vocal cords were suspicious of ulceration He therefore referred the patient to me for radiographic examination of the chest for either aneurysm, new growth, or tuberculous disease of the lungs

The patient complained of difficulty in breathing hoarseness, loss of weight, slight cough and expectoration, and pain below the left shoulder blade On *x* ray examination of the chest extensive symmetrical mottling of both lungs was seen with very little movement of the diaphragm The radiograph (Fig B) is typical of extensive tuberculous disease of both lungs, and a report was sent to this effect The sputum was then examined and found to be positive

Case III

A male, aged 52 was sent to the *x* ray department for examination of the gastro intestinal tract *with the diagnosis of* ' gastritis" He complained of vomiting and retching in the morning, cough with slight expectoration pain in the left side of the chest and abdomen and shortness of breath

He had been quite healthy up to four years before examination, when he began to suffer from a troublesome cough and noticed he was short of breath There was retching in the mornings with occasional vomiting His doctor diagnosed "gastritis and told him that his lungs were normal He was treated for gastritis for two years, but was gradually getting weaker and losing weight During this time his chest had been frequently examined and always pronounced normal

The radiological examination of the gastro intestinal tract proved negative and I therefore examined the chest I found mottling of both lungs and reported that the *x* ray appearance of the chest pointed to extensive tuberculous disease of the lungs The sputum was subsequently examined and found to be positive

I would draw attention in this type to the equal distribution of the disease in both lungs—that is, the symmetrical nature of the lesion Melville,[1] in a paper on "*Pulmonary tubercular disease as shown by x rays* but without physical signs," suggests that his cases were not diagnosed clinically because (1) "the presence of slight emphysema tends to mask physical signs, and emphysema was present in certain of my cases," and (2) "abnormalities in the percussion note and in the breath sounds are not readily detectable at a greater depth than about 4 mm from the lung surface where the area of infiltrated lung is small in extent"

Now in the three cases above quoted there was no evidence to suggest the presence of emphysema, and certainly the lesions were not small in extent, we must therefore look for some other cause to account for the failure to detect these cases clinically I would suggest that this failure to diagnose cases of symmetrical disease is due to the lack of a basis for comparison between the two lungs On physical examination the expansion, though diminished, is equal on both sides, the percussion note and breath sounds are similar, vocal fremitus and crepitus are equal, for these reasons the chest is passed as being normal and some other cause is looked for to account for the patient's cachexia

Type II

My next type is that in which the patient is sent for radiographic examination of the chest to confirm a clinical diagnosis of a tuberculous lesion at one apex The *x* ray examination reveals extensive mottled shadowing of the whole of both sides of the chest with the exception of one apex—the unsuspected one

Case IV

A female, aged 17, was sent to the *x* ray department on March 8th, 1924, with the diagnosis "suspected tuberculous disease right apex" She complained of cough expectoration, night sweats, loss of weight, and shortness of breath The family history was excellent She stated that she had been quite well up to six weeks before examination

Screening demonstrated mottling of both sides of the chest with the exception of the extreme left apex, as shown in the radiograph (Fig C) The sputum was examined and found to be positive

Case V

A male, aged 36 was sent for *x* ray examination of (1) the chest for suspected tuberculous disease of the left apex, and (2) the gastro intestinal tract for suspected gastric ulcer He complained of slight cough and expectoration and pain in the epigastrium after food There was no family history of phthisis The patient had always been healthy up to four years before examination when he had had a slight morning cough and expectoration There was no history of haemoptysis During the last three months he had lost weight and become very weak

The radiographic examination revealed extensive mottling of both lungs except at the right extreme apex Movements of the diaphragm on both sides were restricted owing to the presence of adhesions The examination of the gastro intestinal tract after a test meal revealed only simple gastroptosis and enteroptosis

I have mentioned the examination of the gastro intestinal tract because the patient's doctor considered this to be the important lesion He was extremely surprised to learn that I considered that the radiological findings pointed to advanced tuberculous disease of both lungs with the exception of the right apex, and sent the patient to a private sanatorium for confirmation The findings were confirmed, but the case was considered too advanced for sanatorium treatment The sputum was found to be positive, and the patient died three months later

I submit that the lesion is diagnosed at one apex because here there is a basis of comparison on clinical examination The affected apex shows diminished expansion, dullness on percussion, increased vocal fremitus and resonance, and probably some adventitious sounds The condition in the remainder of the lungs is missed for the reasons stated under Type I

Type III

This type is frequently met with in insurance cases The patient, usually a male, wishes to take out a life insurance policy Although the physician who examines him can detect no physical signs, he hesitates to give a clean bill of health as possibly the patient has been in a sanatorium for a few months years previously The radiographic examination in these cases frequently reveals calcareous patches, usually in the region of the apices, pointing to an old healed lesion The following case illustrates this type

Case VI

A male, aged 42, was referred for *x* ray examination of the chest for "any evidence of tuberculous disease of the lungs" The patient looked the picture of health and weighed 203 lb He stated that seven years before he had been "off colour" for some little time and *had spent four months in a sanatorium* He wished to take out a life insurance policy, and the doctor who had examined him stated that he could find no clinical evidence of any tuberculous lesion

On radiographic examination, however, definite opaque shadows were present at the right extreme apex (Fig D), pointing to calcification having taken place in a healed tuberculous lesion

Types IV and V are in an entirely different category.

TYPE IV

The patient is sent to the x ray department for examination of the chest for suspected tuberculous lesion at one apex. The radiograph on the suspected side shows a cervical rib of the type which as a rule joins the first true rib near its sternal end, but the lung itself gives no suggestion of tuberculous disease. One case will illustrate this type.

CASE VII

A female aged 25 was sent for radiological examination of the chest with the diagnosis phthisis right apex. She complained of pain in the right side of the chest for loss of weight slight cough and expectoration following influenza eighteen months before. The sputum was negative.

The radiograph (Fig. E) showed the presence of a cervical rib on the right side which almost joins the first true rib in front. There was no suggestion radiologically of tuberculous disease of the lung.

In this type of case the cervical rib, the presence of which is unsuspected, gives rise to some lagging at the apex, slight dullness on percussion and rather distant breath sound, thus simulating an apical tuberculous lesion.

TYPE V

A chest in which there is a marked degree of scoliosis combined with kyphosis gives rise to considerable difficulty to the physician, especially when he is required to make a negative diagnosis of tuberculous disease.

CASE VIII

A female aged 20 was sent to the x ray department for examination for suspected tuberculous disease of the lungs. She complained of a troublesome cough, slight loss of weight, shortness of breath and pains in the back. The sputum was negative.

The radiograph (Fig. F) shows a marked degree of scoliosis combined with kyphosis, the latter suggesting tuberculous phthisis.

In this type, therefore, the radiographic examination is of supreme value whether negative or positive.

CONCLUSION

I would emphasize the following points:

I. The importance of the co-ordination of the clinical with the x ray findings, for in many cases it is by this means alone that we can arrive at a definite and reliable diagnosis and prognosis.

II. The radiological examination should preferably be carried out by a trained radiologist, and it is essential that the x-ray findings and report should be made by him. Only too frequently one finds that in the smaller hospitals, and especially in tuberculosis centres, the x ray department is left in charge of the house-surgeon or tuberculosis officer, with no training in radiology, who tend to rely on the screen examination or on indifferent radiographs and to make the x ray appearances coincide with their clinical findings.

III. I would lay stress on the importance of taking a "diagnostic" radiograph in addition to carrying out the routine screen examination, for the negative x ray film will show details which even the practised eye under the most favourable conditions fails to detect on the screen. Further, one has a permanent record of the condition so that if, at any future date the patient returns for another examination the previous radiograph can be produced and the two compared.

THE INDICATIONS AND CONTRAINDICATIONS FOR ARTIFICIAL PNEUMOTHORAX

BY

F. G. CHANDLER, M.A., M.D., M.R.C.P.,

PHYSICIAN WITH CHARGE OF OUT-PATIENTS, CHARING CROSS HOSPITAL; PHYSICIAN, CITY OF LONDON HOSPITAL FOR DISEASES OF THE HEART AND LUNGS, VICTORIA PARK.

THERE has recently appeared an article[1] on artificial pneumothorax in which the writer advocates the treatment for cases of early pulmonary tuberculosis, and in which the following sentence occurs:

> I now come to my great point and it is this: that I think in the future we shall not postpone the induction of artificial pneumothorax until other methods have been given a trial but we shall carry it out at the earliest possible moment after the discovery even of early consumption. If the patient refuses the treatment and prefers to try the effect of sanatorium methods or high altitudes first that must be his affair. As doctors I think we should advocate the induction of artificial pneumothorax on the affected lung at once and then encourage the patient to stay in a sanatorium or at a high altitude if there is any suspicion that the other lung is affected.

This opinion raises a highly controversial issue and demands in my opinion a challenge.

Dr. Clive Riviere, who was a pioneer in this subject in this country, and one of its strongest advocates when the treatment was looked upon with indifference or mild amusement, writes as follows:

> A qualification even more important in the writer's opinion than that afforded by bilateral disease exists in the presence of early phthisis. The application of pneumothorax treatment to these cases can be shown on many grounds to be contraindicated. In the first place it is unnecessary since early phthisis is a disease readily curable by other methods; in the second place it is inexpedient since it brings with it risks and the chance of serious complications out of all proportion to the benefits it can confer. Pleural shock and gas embolism are perhaps but infinitesimal risks where modern methods are properly applied but they cannot be altogether eliminated. Furthermore pleural effusion and the deformities which may follow it are complications which cannot in any way be avoided. Such effusions occur altogether in nearly 50 per cent. of cases and though the shorter treatment required for slight disease would reduce this percentage yet effusions must occur in many and lung expansion fail or be incomplete in a few. Moreover on re-expansion the pleural layers may become adherent and the patient be thereby deprived of this treatment at a later stage when it may be full indicated. In some cases perhaps the production of a pneumothorax at an unusually early stage may be justified on economic grounds where time must be shortened in the case of a patient who is obliged to return to his occupation.

FIG. 1.—Before treatment by artificial pneumothorax.

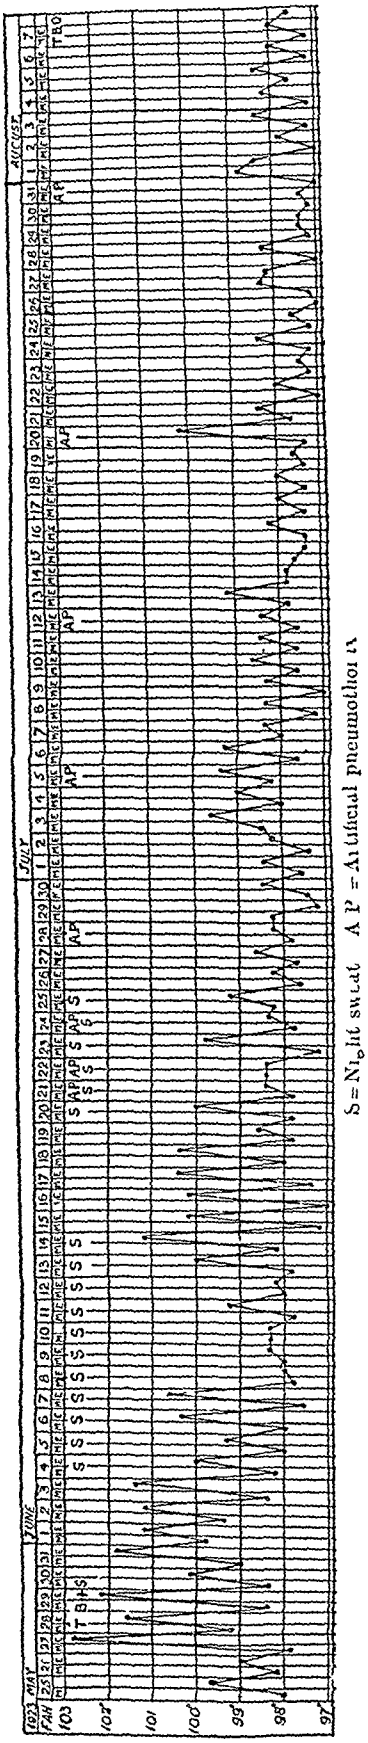
FIG. 2.—After pneumothorax well established.

Falkberg of New York in his classic work on pulmonary tuberculosis writes thus:

> There are some who believe that even in incipient cases one ought to treat with pneumothorax. Among those may be mentioned Murphy, Lees, Bullock and Trudeau, Graham, Forlanini, von Adelung, Pierson and some others. Murphy and Kretschmer say: Is it well to wait until the condition is so desperate? Is the lung collapse such a desperate operation as to be used only as a last resort? With this I am not in agreement. It the treatment is related only a certain and limited time. The patient could be informed of the details and given the choice. But we are not as yet in a position to give the patient definite information as to the probable duration of collapse treatment and a large proportion of these cases recover under the old and tried methods. I would not subject mild incipient cases to the dangers, complications and duration of pneumothorax.

This, I must confess, is my own faith, and I know that if I had an early tuberculous lesion in the lung I should not have an artificial pneumothorax performed upon myself, but I would have treatment on strict sanatorium lines, whereas if I had a progressive lesion I should, without hesitation, accept pneumothorax treatment

There is little doubt that the immense value of artificial pneumothorax in selected cases lacks appreciation in this country, but its cause is not likely to be furthered by exuberant advocacy So many cases of early phthisis show a tendency to spontaneous cure, so many cases of a fibrotic type of pulmonary tuberculosis display such chronicity and detract so comparatively little from the general health and activity of the individual, that many a false remedy gains a reputation for healing in this disease Artificial pneumothorax has not hitherto been employed in such cases to any extent in this country, the test has therefore been severe, it has stood the test, and all those experienced in this treatment are convinced of its value



As an example of what artificial pneumothorax can do in phthisis, and of what I consider an ideal case from the point of view of suitability, response to treatment, result, and convincingness, I will quote the following

A woman, aged 29 was admitted to Victoria Park Chest Hospital on May 25th 1923 complaining of cough, expectoration, loss of weight, and night sweats She had had so called "influenza" at Christmas, 1921, and had not been well since, suffering from cough, weakness, palpitation, and expectoration A few months before admission tubercle bacilli had been found in the sputum On admission she was wasted, with high fever and night sweats The physical signs of disease were very marked on the left side and the heart was considerably displaced to the left The accompanying radiograph shows the extent of the disease, the temperature chart the degree of its activity

Artificial pneumothorax treatment was begun on June 21st It might be thought from the displacement of the heart and the apparent fibrosis that collapse of the lung would be unlikely Excellent though not absolutely complete, collapse, however, came about without any difficulty There can be little doubt that without the treatment the patient would have gone steadily downhill

From the chart it can be seen that the temperature soon fell the sweats ceased the sputum became negligible then absent tubercle bacilli disappeared and soon the patient was able to get up She is now doing her household duties and is a cheerful and comparatively healthy woman She has kept a temperature chart regularly ever since and there has never been a rise of temperature She comes up for refills once a month

I am well aware that one case proves nothing, but this is only one of many similar cases Many a patient with a fibrotic type of the disease may present physical signs as extensive and give an X-ray picture as bad as that shown here, and yet have few symptoms of active tuberculosis and live a fairly unrestricted life for many years But this case, though indeed fibrotic, evidence of which can be seen by the displacement of the heart to the left, leaving the intervertebral discs uncovered, showed every sign of marked activity and downward progression She was cyanosed and wasted, breathless and toxic there were sweats almost nightly and high fever

In such a case, I take it, there can be no two questions about the desirability of treatment by artificial pneumothorax

Indications

In my opinion the following are the indications for this treatment First, pulmonary tuberculosis of one of the following types

1 The disease has been recognized, let us say, fairly early after the onset of definite symptoms There are physical signs on one side The patient is given absolute rest under good conditions, but the disease spreads The temperature will not become normal, or rises immediately any exertion is made, the sputum perhaps does not decrease, nor does it become free from tubercle bacilli

Such a case would cause great anxiety The physical signs seem to be confined entirely to one side Two or three months have passed by and still there is activity, which implies spread of the disease It is now that artificial pneumothorax should be thought of, and the chest should be X-rayed to exclude as far as possible an unexpected or deep-seated disease on the other side This radiographic examination is essential Without it we cannot form an opinion of value Without it we are only justified in embarking on artificial pneumothorax treatment in exceptional circumstances There may be much deep-seated disease, which is not and cannot be detected by physical signs I am not referring to the hilum shadows and striation so often stigmatized as tuberculous by the radiologists, but definite stippling, mottling, and opaque shadows away from the hilum, which are undoubtedly pathological If after this examination the lung which appeared sound by clinical observation appears sound or nearly so by X-ray examination then artificial pneumothorax treatment can be started

2 The second type is a case where the diagnosis has been missed, or the patient has ignored his symptoms and has not sought medical advice The disease is advanced There is cough and much expectoration, wasting, and weakness, perhaps an occasional slight haemoptysis or a night sweat There are marked physical signs, but almost entirely on one side, perhaps one or more cavities can be detected In such a case, if there were not marked and definite improvement after a month's complete rest, artificial pneumothorax would be indicated

3 For the third type I would instance more chronic case There may be cavitation or much fibrosis, but the disease is still practically unilateral, of this the case described above is an example If after rest there are still symptoms—fever, sputum, haemoptysis—or the patient can live only a hopelessly restricted life, then artificial pneumothorax is indicated

Other indications are, in my opinion, as I have expressed elsewhere,[4] the following

(*a*) In a case of pleural effusion, if there is evidence of active tuberculosis in the lung of the same side, such as the presence of tubercle bacilli in the sputum or history of haemoptysis, etc, and the other lung is clear or fairly clear, in such a case I should first replace the fluid by oxygen or air, and then maintain the pneumothorax

(*b*) Recurrent chronic pleural effusion

(*c*) Certain cases of bronchiectasis

(*d*) Cases of foreign body in the bronchus that cannot be

removed through the bronchoscope, in this case I feel that it is the only possible treatment that can give relief, short of a very grave surgical operation

(*e*) Certain cases of foreign body in the lung

(*f*) For diagnostic purposes for revealing tumours and their attachments by radio copy and thoraco copy

(*g*) In certain cases of abscess of the lung

(*h*) As a preliminary to operation in certain cases

(*i*) To control haemoptysis

Contraindications

The following contraindicate resort to the production of artificial pneumothorax

1 Active disease in both lungs This rule, however, must not be applied too rigidly, for many cases have been successful in which there was some disease on the other side

2 Early phthisis which is becoming arrested by strict treatment on ordinary lines Far greater efforts must be made generally towards diagnosing the disease when it is really early Many cases called early are in reality advanced

3 Emphysema or asthma are said to be contraindications and if severe would obviously be so, but I have induced a pneumothorax in an asthmatical subject with no apparent ill effects

4 Extensive tuberculous disease elsewhere

5 Reluctance, undue timidity, lack of patience or of confidence on the part of the patient

In writing thus I have intended to express an opinion not to lay down the law It would be beyond the intended scope of this paper to discuss what is early pulmonary tuberculosis, and yet it is a question intimately associated with the problems of pneumothorax treatment

I take it that all will agree that, given symptoms of toxaemia (lassitude, evening fever loss of weight) and tubercle bacilli in the sputum with no physical signs either clinical or radiographical, or only slight signs the case may be regarded as one of early phthisis, whereas if the signs indicate the involvement of an appreciable amount of lung tissue it can no longer be so regarded

LARGE ABSCESS OF LUNG DRAINAGE BY POSTURE RECOVERY WITHOUT OPERATION

BY

LEONARD MACKEY, M D, M P C P,

PHYSICIAN AT QUEEN'S HOSPITAL BIRMINGHAM

THE following case is interesting because it shows that a large abscess of the lung may disappear completely and fairly rapidly when the patient can discover a posture which enables him to cough up its contents

A B, a carter aged 36, consulted Dr Fraser of Chaetown in September, 1923 on account of epilepsy, from which he had suffered for many years Dr Fraser on that occasion remarked on the extremely septic and offensive state of the patient's teeth, and pointed out the necessity of having them extracted

Before the man could make any arrangements to follow this advice he was taken suddenly ill and Dr Fraser found him suffering from a very acute and extensive pneumonia On September 24th the fourth day of the illness, the sputum became dark brown, copious, and very offensive

On September 27th I saw him in consultation with Dr Fraser and agreed that the physical signs pointed to pneumonic consolidation of the right lung complicated by gangrene or abscess I was unable to strike pus with an exploring needle The patient's general condition was so bad that I felt there was little hope of recovery The slightest movement caused great distress and cyanosis, and to move him from his humble home to hospital was out of the question

I made an autogenous vaccine from pneumococci and streptococci from his sputum he was given a dose the following day and afterwards at intervals of five days For the next five weeks he continued to expectorate a quantity

FIG 1—On admission to hospital showing abscess cavity half full of pus

of putrid purulent sputum The temperature, which was irregular seldom exceeded 103° F He became pale and emaciated and the fingers became slightly clubbed on the whole however, he seemed to have developed some immunity, and the signs of consolidation gradually cleared from the upper lobe so that on November 7th seven weeks after the commencement of his illness he for the first time was considered fit to be moved and was transferred to Queen's Hospital for x ray examination and possibly operation

The radiograph (Fig 1) taken on November 8th showed a cavity half full of pus in the lower half of the right lung The sputum was offensive but not very abundant

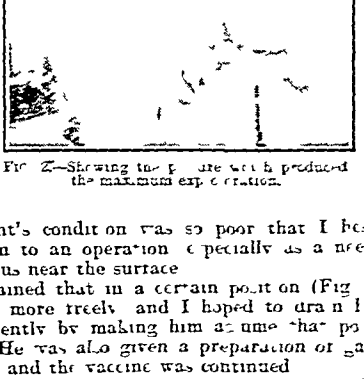

FIG 2—Showing the position which produced the maximum expectoration

The patient's condition was so poor that I hesitated to submit him to an operation especially as a needle failed to locate pus near the surface

I ascertained that in a certain position (Fig 2) he expectorated more freely and I hoped to drain his abscess more efficiently by making him assume that position frequently He was also given a preparation of garlic every four hours and the vaccine was continued

Thereafter his progress was most satisfactory, the sputum lost its foul odour and became rapidly less in quantity, the pyrexia ceased completely, his appetite improved and he gained a stone in weight during the next month Gradually his extremely bad teeth were removed

A radiograph taken about a month after admission showed a great diminution in the size of the abscess He was discharged two months after admission, free from all symptoms of abscess and displaying no physical signs beyond some impairment of resonance over the right lower lobe and some diminution of breath sounds in the same region When next seen, two months later, he was in good health and back at work All abnormal physical

FIG 3—Four months after admission—no trace of abscess Lung fields normal

signs had then completely disappeared, and an a-ray examination (Fig 3) failed to show any trace of his former lesion

My object in publishing this case is to call attention to the striking and immediate benefit which followed the efficient draining of the abscess by the assumption of a suitable posture by the patient, there is nothing new in that

INCUBATIONAL CHANGES IN THE RED CELL COUNT IN INOCULATED MALARIA

(Preliminary Note)

BY

ADRIANUS PIJPER, MD, CONSULTING PATHOLOGIST AND BETH DILL RUSSELL, MRCS LRCP, DPH, ASSISTANT PHYSICIAN, PRETORIA MENTAL HOSPITAL

We have taken up Sir Ronald Ross's suggestion[1] that the treatment of general paralysis with malaria should also serve as an opportunity for studying the incubational period of malaria This note deals only with changes in the red cell count

Our nine patients were all European male inmates of the Pretoria Mental Hospital, most of them of long standing, but still in fairly good condition when the work was started We have used one case of dementia præcox as a control All patients were treated with one and the same strain of benign tertian malaria

Method Employed

Quantities of blood, varying between 0 5 and 10 c cm, were taken from the vein of a patient with malarial fever, under aseptic precautions, but with no regard to the stage of his fever This quantity was then immediately injected under the skin of the new patient, divided over as large an area as the needle could reach, and well rubbed in

A drop of blood from the finger was diluted 200 times with the usual pipette, and counts were made with a Thoma-Zeiss counting chamber From every pipette two drops were counted separately, and a hundred small squares were counted every time

In a few cases morning and evening counts were made on the same patient In the absence of fever there was hardly any discrepancy, but an intervening rigor always lowered the count In such cases the mean was taken The routine procedure, however, was one daily count performed at approximately identical hours for every patient In every case counting was started a few days before the injection so as to obtain the average count

Results

Sir Ronald Ross[1] mentioned that S Ben-Hariel saw the red cells diminish, in canaries inoculated with Proteosoma, as early as the day after inoculation, and this decline was progressive day after day, until from 0 5 to 2 million had disappeared from the original normal count of 4 5 to 5 million We have found the exact opposite, as shown in the table In it we have included other details about our patients which might be thought to have a bearing on the phenomena observed, although the connexion is none too obvious

TABLE

Case Number	Dose Injected	Incubation Period (days)	Average Cell Count before Injection (millions per c mm)	Highest Count Reached (millions per c mm)	Lowest Count Reached (millions per c mm)	Malaria in Patient's History	Duration of Fever (days)	Fever stopped by—
	c cm							
1	3	12	4 7	6 4	3 1	?	33	Itself
2	2	9	4 7	6 7	3 2	?	30	Neosalvarsan
3	4	9	5 6	6 7	3 2	?	17	Neosalvarsan
4	5	6	5 4	6 25	3 5	?	19	Neosalvarsan
5	1	12	4 8	6 2	2 9	had	58	Neosalvarsan
6	0 5	17	4 7	6 5	3 65	?	47	Neosalvarsan
7	1 5	18	5 9	6 4	5 2	had	15	Itself
8	2	9	6 8	7 9	6 5	?	12	Death
9	10	14	5 9	6 8	5 3	had	5	Itself

At the altitude of Pretoria a red blood count of nearly 6 million may be regarded as normal From the table it is seen that many of our patients were anæmic before the injection of malarial blood The high count reached by all of them after the injection is all the more remarkable The very low count following on this is the usual malarial anæmia But neither the rise nor the fall seems to stand in any fixed relation to the other features to previous malarial history, to the dose of blood injected, and to whether we used neosalvarsan to stop the fever or it ceased of itself

From our observations it is clear that an injection of malarial blood is followed by a rapid and marked increase in the number of red cells This increase is followed by a decrease, and this decrease coincides more or less with the outbreak of fever, or possibly with the appearance of malaria parasites in the peripheral blood stream Since all the cases injected with malarial blood showed this increase in cell count, and the one case injected with malaria free blood showed no change at all, we may safely hold the malaria parasites responsible for the increase This view is further supported by an observation in another patient who had received an injection of malarial blood but for some reason never got as far as a rigor He just showed an irregular slight rise of temperature for a couple of days, after which the fever died out entirely In this case a rise in the number of red cells was recorded from 5 04 to 5 78 million

Conclusions

A subcutaneous injection of from 0 5 to 10 c cm of blood containing benign malarial parasites is quickly followed by a rise in the red cell count amounting to somewhere between 10 and 30 per cent This rise lasts several days, with minor daily variations, and is followed by a fall, which constitutes the malaria anæmia

As an injection of malarial blood cannot very well lengthen the life of red blood corpuscles, the rise can only be explained

as in the production of red blood cells Normal blood has no such effect

An injection of malarial blood is a direct stimulus for the red bone marrow toward increased activity This stimulus might be applied for therapeutical purposes (forms of anæmia, especially chlorosis) The outbreak of tertian always be prevented by an injection of a small amount a the increase in red cells is well established The whole process could then be repeated

We wish to thank the public health authorities of Natal for assisting us in obtaining the strain of malaria Dr Grimmer Verulam for his very kind and courteous co-operation in the matter Dr J T Dunston Chief Medical Officer for Mental Hygiene of the Union of South Africa for giving us every assistance while making these investigations and Dr Swift Acting Chief Commissioner for Mental Hygiene for his kind permission to publish this note

SMALL-POX AN UNRECOGNIZED OUTBREAK

BY

T A SHAPPE M D B S LOND D P H LEEDS

MED CAL OFFICER OF HEALTH PRESTON

THE following history illustrates the behaviour of unrecognized small pox in a community where the only control was the previous partial vaccination of the contacts and the fact that it occurred in institutions under discipline and observation The facts are related as they came to my knowledge in order better to convey the method by which the outbreak was discovered

On Saturday, February 10th I was asked by the medical attendant to see a girl resident in an institution for female adolescents which is supported partly by voluntary contributions and partly by laundry work I gave it as my opinion that the patient was suffering from chicken-pox and very much relieved the administration by offering to remove the case to the Preston Isolation Hospital This offer was accepted, and the patient was removed to an isolation ward in the diphtheria block at the isolation hospital

During the week-end I became suspicious of my original diagnosis, and asked Dr Fisher of the Lancashire County Council staff to see the case He diagnosed the case as one of small pox the points being

1 The rash was preceded by a definite illness on February 6th—headache pains in the back and sickness

2 The rash first appeared on the face and forehead on February 13th

3 When the rash was fully developed (February 16th) it tended to affect the extremities rather than the centre of the body and the exposed rather than protected surfaces Thus the back of the hand and the arm the front of the leg and the forehead were affected whereas the abdomen the groin and the front of the neck were free

4 The rash appeared in one crop upon the face and appeared successively at different sites lower down the body affecting the feet last thus the rash on the face was much older than that upon the feet and all the spots upon the feet were of the same age

5 The spots were circular and deeply seated in the skin

6 The vaccinal condition was definitely negative

7 Re-vaccination was not successful

The diagnosis was agreed to by my assistant and the original medical attendant of the case and by the medical officer of the small-pox hospital to which the patient was removed on that day She made a good recovery but was somewhat scarred There were no subsequent cases

The usual inquiries as to the source of infection revealed the fact that the laundry was regularly receiving parcels of laundry work from an adjoining institution for boys This home is managed by a religious brotherhood and receives fifty resident boys on behalf of the Home Office At this home on December 25th there occurred an illness in one of the boys A rash appeared on December 29th I saw the case on December 31st in consultation with the medical officer and diagnosed the illness as chicken-pox Bearing this case in mind I at once inquired as to the subsequent history and found that fourteen additional cases had occurred as shown in the table

Case	Date of Onset	Vaccinal Condition	Case	Date of Onset	Vaccinal Condition
1	Dec 29th	Old	9	Jan 14th	Negative
2	Jan 4th	Negative	10		Negative
3		Negative	11	Jan 16th	Negative
4	Jan 6th	"	12	"	"
5	"	Negative	13	Jan 17th	"
6		Old	14	Jan 18th	Negative
7	"	Negative	15	" "	Negative
8	Jan 11th	Negative			

The cases all suffered from an illness similar to that of the first boy The rash was limited to the face neck arms and back and did not in any instance affect the palms or soles The rash appeared first on the face and forehead and rapidly developed into an eruption of discrete vesicles and pustules by the date of the visit (February 16th) all the boys were in bed and running fever with the exception of the cases The pustules on the hands knees and feet were deeply seated in the skin and showed characteristic umbilication Individual attacks also indicative

An examination of the remaining boys showed that with one exception all had been vaccinated either in infancy or subsequently Most of the vaccinations had been performed by the medical officer of the institution who had arranged for the vaccination of the whole of the boys who had been previously vaccinated In view of the age of the attempt to vaccinate was unsuccessful born on February 1st and February 15th In one case which in its attack had only a single spot and no scar the vaccination was successful The seven of the fifteen cases in the table were unsuccessfully re-vaccinated on February 20th

In view of the fact that the usual experience of public vaccination, using Government lymph is 99 per cent of success and a slightly lower figure for infection succeeding the unsuccessful attempts to vaccinate these unvaccinated boys was the subject of correspondence between the public vaccinator and the Government lymph establishment to which my attention was called by the Minister of Health early in March

Summarizing, I found that an epidemic illness resembling small-pox had occurred and that it had (1) infected all but one of those eight boys not protected by previous vaccination (2) infected seven boys protected by previous vaccination (3) failed to infect forty-nine boys and staff protected by previous vaccination (4) rendered these infected immune to vaccination

On January 22th the nurse who had attended to the sick boys took her uniform to the laundry at the girls' institution The case in the latter home occurred on February 8th—seven days later

Several interesting points arise The attack rate was as follows

Institution	Period of Exposure	Previously Vaccinated	No of Cases	Percentage	Unvaccinated	No of Cases	Percentage
Boys Home	Unlimited	46	7	15.5	5	3	3.3
Girls Home	3 days	14	—	—	6	1	16.6
Isolation Hospital	2½ days	43	—	—	4	—	—

The total contacts at the time of the outbreak numbered 118 of whom 111 had been previously vaccinated and 15 were unvaccinated All with 10 exceptions (seven army vaccinations 3 refusals 2) were submitted to vaccination in connection with the small pox outbreak

The case incidence in the previously vaccinated was 7 in 68, or 21.5 per cent

In the 14 who had never been vaccinated or successfully in all but one case

Detailed charts sent with this paper have been omitted owing to want of space

An examination of the dates of attack in the boys' home shows that Case 1 infected the remaining cases, and that the removal of the subsequent cases to a separate dormitory without any special precautions was sufficient to check any further spread of the disease Although the unprotected were with one exception attacked, yet they were not, as one might expect, attacked first Cases 7, 8, 9, and 10, who were previously vaccinated, became infected before Cases 11, 12, 13, 14, and 15, who were not All the cases were of the mild type, and there was no practical difference in severity between the cases arising among the protected and the unprotected In the girls' home secondary cases were looked for with some assurance Their immunity was perhaps due to the fact that each girl had a separate bedroom The boys' home is planned on the dormitory system

THE LIFE-HISTORY OF A CASE OF MYXOEDEMA

BY

HUGH M RAVEN, M R C S, L R C P,

BROADSTAIRS

This case of myxoedema was reported in the Journals of January 6th, 1894, and July 31st, 1897, by my father, and is, I think, an unusually long record of a patient continually under observation

Mrs S was born in May, 1829, therefore when she died in January, 1924, she was over 94 years of age The

Fig 1 Original condition, aged 41

Fig 2—After five weeks treatment

symptoms of myxoedema began in about 1870, and were untreated for twenty years, by which time she was bedridden and imbecile, and her appearance is to be seen in photograph 1 After five weeks' treatment with thyroid

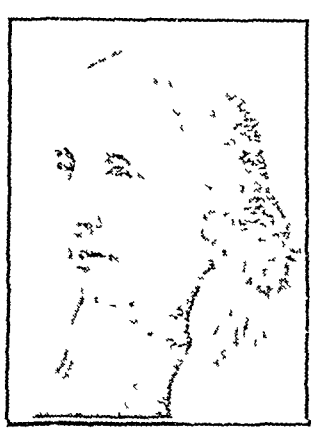

Fig 3—After fifteen months treatment

Fig 4—At age 94 after over thirty years treatment

tablets her mental condition had much improved, and the condition of the skin generally was clearing up (photograph 2) After fifteen months' treatment she was practically normal again (photograph 3), the regrowth of the hair is to be noted Within a year or two she was well enough to nurse her daughter through an attack of typhoid, and lived to a ripe old age—happy, healthy, and mentally active

It was noted during the early years after her recovery that she appeared mentally younger than a woman of her age, and it was suggested that the twenty years of myxoedema had given her twenty years of rest, from which she benefited in the long run

As far as my information tells me, she had five grains of extract of thyroid twice a week at the commencement of the treatment, and after recovery she had one grain twice a day for the rest of her life I have little doubt that during all these years the thyroid was not always taken regularly, but there was never any recurrence of the symptoms The thyroid gland remained impalpable

The fourth photograph shows her shortly before her death, which was caused by bronchitis

ABSCESS OF FRONTAL LOBE OPERATION RECOVERY

BY

S W SWINDELLS, M B, Ch B,

AND

A H RANKIN, D C M, M B, Ch B,

GRIMSBY

The following case appears to be of interest on account of the unusual path of infection—namely, from the frontal sinus—and is confirming certain mental symptoms in lesions of the frontal lobe

G R aged 23 dock fireman was first seen by A H R on October 27th, 1923 He complained of pain in the lower jaw on the left side and headache which had lasted for six days Two days previously he had vomited once

There were found oedema of the left upper and lower eyelid, and tenderness over the left maxillary region There was also an area of extreme hyperalgesia of 1 inch radius situated 2 inches to the left of the mid line, and 2½ inches above the orbital ridge The pupils were equal and reacted to light The fundi appeared normal on ophthalmoscopic examination Transillumination tests showed dullness in the left antrum of Highmore and the left frontal sinus also appeared relatively dull The temperature was 103° F and the pulse 50

In the course of a few days these symptoms abated, but on November 7th the oedema of the eyelids returned and the headache increased The temperature varied from 99·5° to 101° F, and the pulse from 66 to 90

Operations

On November 9th he was removed to the Grimsby Union Infirmary, and the wash out test having given a positive result on the left side the left antrum of Highmore was drained through the canine fossa a large quantity of fluid pus being liberated On the following day (November 10th) the left frontal sinus was opened by the direct route It was found to contain glairy inspissated pus No backward track could be detected Both operations were performed by S W S

The temperature again became normal and the patient felt much better generally so that it at first seemed that the whole condition might have been due to the sinus disease only During this period the temperature never rose above 99° F, and the pulse varied from 62 to 100

Mental Disturbance Third Operation

On November 19th the headache once again became severe, the left eyelids oedematous, and the left pupil slightly dilated The patient refused to allow his dressings to be touched, or his mouth to be cleansed Though up to this point his behaviour had been exemplary, he now refused all food and became violent and abusive towards his nurses It was difficult to obtain answers to questions, and these were given slowly after an interval of a few seconds He became very weak, and nutrient saline was commenced

On November 27th the fundi were again examined and found normal Both handgrips were very weak, but that of the right hand weaker than the left In spite of his now semi-comatose condition pressure on the scalp in the region defined above caused the patient to wince On this date the pulse was 48

On November 28th a third operation was performed by A H R A vertical incision was made 3/4 inch to the left of the middle line extending for 2½ inches upwards from the orbital ridge The skull was trephined above and to the left of the frontal sinus The trephine used was 1 inch in diameter The dura mater bulged into the opening and there was no pulsation At a point corresponding to the upper limit of the left frontal sinus there was a marked granulated area This was believed to represent the track of the causal organisms The membranes and cortex were incised and pus was found at a depth of 3/4 inch Five ounces of pus were collected, the patient being turned face downwards to facilitate

its escape A gauze drain was left in the sinus which measured 2½ inches in length

Next day the patient's disposition was found to be entirely different He was again quite tractable and answered questions with less difficulty Twelve days after the operation he had two epileptiform seizures and for a fortnight he had several similar attacks On January 6th 1924 all packing was removed and after a fortnight later the wound was allowed to close completely The patient was discharged well on February 6th having been free from symptoms for six weeks

Mr D S Campbell M B who was associated with us in the treatment of the case undertook a bacteriological examination of the pus and reported that it showed a mixed infection micrococci predominating with numerous groups of staphylococci

As is usual in such cases the patient is unable to recall any of the events of his illness prior to the relief of the intracranial pressure—for instance he does not remember ever having been visited at home or having been removed to hospital

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

PUERPERAL FEVER AND ATROPHIC RHINITIS

In parts of June and July 1923 a number of patients at the Portsmouth Municipal Maternity Hospital exhibited temperatures above normal without any obvious cause without physical signs and without symptoms apart from mild malaise which was present in a few instances While investigations were still proceeding complaints were made regarding a faint unpleasant odour alleged to be attendant upon a certain recently enrolled pupil midwife and she was examined with a view to ascertaining its cause It was just previous to this that it had been noted that the patients under observation had all been attended in some way or other by the same pupil midwife Advanced atrophic rhinitis with extensive crust formation was found and she was requested to return home and place herself under treatment This she did and the temperatures referred to all became normal almost at once

Nearly three months later she submitted a medical certificate and was allowed to return Almost immediately however, the temperatures of those patients with whom she came into contact began to rise but more markedly than before She submitted to re-examination and the condition was found to be very little changed from that noted at the previous inspection A culture taken from the nose showed haemolytic streptococci The opinion of Mr C A Scott Ridout M S F R C S, was obtained and on his advice she again retired for treatment As before, the temperatures immediately subsided

TABLE I.—*Temperatures June 12th to July 9th*

	Temperatures	Duration
Case 1	99	First to fifth evenings
Case 2	99	Fifth to tenth evenings
Case 3	99	Three evenings
Case 4	99·6	Evening of the first week
Case 5	99	Evening of the first week.
Case 6	99	Every evening
	100	Eleventh evening

TABLE II.—*Temperatures October 8th to 23rd*

	Temperatures	Duration
Case 1	99–100·6	First to fifth evenings
Case 2	99	Fifth to seventh evenings
Case 3	100	Evenings of the first week
	101·8	Fourth evening
Case 4	99–100	First to tenth evenings
	103·2	Tenth evening

It will be noted that nearly all of the cases in Table II should have been notified It should also be mentioned that of all these cases in both tables, this pupil midwife was present at the delivery of three only and even then she was too junior to do more than look on

Since the temperatures subsided on the removal of the "carrier" from attendance, it is justifiable to assume that the cause of the rise was not result bacterial, though almost certainly bacterial in origin No theory is submitted as to the mechanism by which the reaction was produced, but it may be emphasized that the carrier suffered from a *chronic* infection

Darlington P KELSON FOLD, M B, B S

TREATMENT OF SPRUE BY CALCIUM AND PARATHYROID

THE following short notes on two cases of sprue treated by calcium lactate and parathyroid extract are submitted in reference to the article by Dr H H Scott in the BRITISH MEDICAL JOURNAL of August 23rd (p 305)

CASE I

A B male aged 22 single spent a year on the Indian frontier with six months home leave in 1921 He came home in 1923 He had had bilious diarrhœa

In October 1923 the symptoms of sprue began copious early morning stools flatulence of abdomen and sore tongue He was seen in consultation on March 5th 1924 when there was anæmic tinge on the conjunctivæ an atrophic tongue and a tumid abdomen with a palpable liver The teeth were characteristic of sprue No abnormalities were detected in any other system The patient was ill and very irritable He was put on a suitable diet and given parathyroid extract (Armour) 1/10 grain twice a day with calcium lactate Seen again on March 27th there was no soreness of the tongue the stools (three daily) were pale not frothy nor abnormally large Slight tenderness of the colon persisted but the colour and the general outlook were good On June 13th the parathyroid dosage was cut down to once daily The general condition was extremely satisfactory and there was no recurrence of untoward symptoms At the present time he can play golf and lead an active normal existence both mentally and physically He is having no treatment but drugs and can digest any food but he has been advised still to exercise care in his diet

CASE II

C D female aged 40 married no children went to India in 1910 had several short holidays in England and a long furlough from May 1914 till November 1916 She returned home finally in 1921

She had a sore tongue before leaving India in 1921 which had on the voyage home She had been in fair health till six months ago when she was subject to much worry since then she has had a sore tongue flatulence and copious pale offensive frothy stools She gave a history of retrosternal burning on taking food and of sudden vomiting without nausea at night When seen on June 14th 1924 she was very ill and confined to bed She was extremely emaciated with a cachectic skin The characteristic sprue tongue was present with denuded epithelium and ulceration The abdomen was tumid but there were no other abnormal physical signs in chest or abdomen and no disease of the central nervous system The diet were normal but pale She was put on (two-hourly feeds of milk peptonized milk and whey and meat juice Parathyroid extract (Armour) 1/20 grain was given twice a day with calcium lactate The dose was gradually increased the symptoms subsided When last seen on August 20th the stools and tongue were normal there was no sickness the weight had increased the colour was good and she felt well The diet was practically normal but taxing was still restricted The parathyroid extract was stopped

EXPULSION OF WHOLE PLACENTA PRÆVIA

THE following case must be of great rarity and seems of sufficient interest to record

On May 15th I was called to a confinement at 5 a m The patient was a multipara (ten previous pregnancies and there was a history of several miscarriages and premature births On arrival I was surprised to see the entire placenta lying on the bed and naturally concluded that the child was born but on inquiry I found that this was not the case There was no haemorrhage

I made an examination and found there was a transverse lie with impaction of the shoulder Chloroform was administered version performed and the child (or coccyx lead) was delivered without any further trouble The puerperium was uneventful

I think there is no doubt that the condition had been one of central placenta prævia and that as labour had progressed the attachments of the placenta had been loosened and it had been expelled whole

I learned that there had been a sudden gush of blood when the "after birth" was born but this had quickly subsided and there had been no further haemorrhage

To my mind the remarkable features of the case are first that expulsion of the entire placenta could take place without its being ruptured and secondly that there was no serious haemorrhage throughout the case

CHRONIC EPIDEMIC ENCEPHALITIS LETHARGICA

It is now some six years since lethargic encephalitis began to attract the attention of the medical profession in England. During March and April, 1918, a large number of cases of an obscure disease were reported in England. Owing to the frequent occurrence of ocular paralysis it was at first suggested that it might be botulism, and later that it was the cerebral form of acute poliomyelitis (Heine-Medin disease). But it was soon recognized that it corresponded in its clinical symptoms, signs, and pathology with a disease of which three cases described by von Economo and von Wiesner had occurred in Vienna in 1917. The evidence now available seems to establish that it is not a new disease, for epidemics in which lethargy was a characteristic symptom have occurred in various places in Europe during the last three centuries.

Recently a serious recrudescence has been noted in various parts of this country. The cases notified during the first five months of this year numbered 2,473, whereas the annual average for the previous four years was 839. Consequently when Professor Wimmer of Copenhagen asked me to write a preface to his work on *Chronic Epidemic Encephalitis*[1] I replied that I would consider it an honour to do so. Having read the book I felt it was a work which would be of service to the medical profession in England, for it deals with the subject in a masterly manner.

Professor Wimmer produces evidence that a large proportion of cases of encephalitis lethargica—not only the severe ones, but even the mild ambulatory cases—may develop within a few months or a couple of years signs of chronic progressive disorder of the central nervous system. The Ministry of Health has issued several important reports since 1918. Reference may in particular be made to the Annual Report of the Chief Medical Officer of the Ministry for 1922, and to the important memorandum (British Medical Journal, June 14th, 1924, p. 1062) issued this year by the Ministry, in which these late effects are considered to be sequelae. Professor Wimmer and many Continental authorities are of opinion that the encephalitis may remain active for years as an intermittent or recurrent process, but that it is in by far the majority of cases progressive. The symptoms are not sequelae, but due to the active virus. Professor Wimmer quotes Netter's statement to the effect that the encephalitis may be continued for several months, even for several years. The virus, according to Netter, can continue to live in the nervous centres like that of syphilis.

The memorandum above referred to states that in the second quarter of 1924 there were 1,715 cases of lethargic encephalitis in England and Wales. Unfortunately, publications which are issued by the Stationery Office do not seem to obtain the wide circulation documents of so much importance deserve, and Professor Wimmer does not allude to the report in his monograph. It is really astonishing to find how seldom reports published by the Stationery Office obtain recognition in foreign countries. Only the other day I was asked by an eminent scientist who gave most valuable evidence before the Royal Commission on Venereal Disease, where he could obtain a report of the findings of the Commission and the evidence. *The Action of Alcohol on the Human Organism* is another example of a valuable publication buried by the Stationery Office.

Professor Wimmer deals almost exclusively with chronic epidemic encephalitis, although in a short introduction the subject of encephalitis generally is considered. He gives an account of the symptomatology and a description of the psychotic and general nervous disturbances. Recently the Board of Control issued an inquiry to superintendents of mental hospitals relating to patients admitted with mental symptoms occasioned by this disease. Although a considerable number of cases had occurred in Birmingham and district, and the names of the cases noted were sent to the superintendents of Rubery Hill and Hollymoor, not only one of the patients whose names had been notified as suffering from this disease could be identified with patients admitted to these institutions. Professor Wimmer is of opinion that psychic disturbances are likely to be found in children and young adults, who are very liable to exhibit changes of character and morals in consequence of this disease. Of the 271 cases in which sequelæ were noted in the Ministry of Health's report (Report No. 11) quite a number exhibited psychic disturbances, and in the Ministry's memorandum it is pointed out that

> "the after effects in all probability are dependent upon lesions of the cortex of the brain. Irritability, maniacal outburst, lebetude, complete change in moral character and self control, sexual perversions, lying and theft, may appear for the first time in the conduct of the victims of encephalitis lethargica, as well as grosser mental defects including even homicidal mania, and other disorders of conduct which result in the patient's transference to a mental institution. These symptoms are of all grades of severity, and may be associated with nervous lesions."

Dr. Wimmer's experience coincides with this, he states that of twenty-five children who had been treated in 1918-22 in the hospital for epidemic diseases in Copenhagen, eleven died, two could not be traced, and the remaining twelve all displayed to a more or less pronounced degree psychic disturbances affecting especially moral character. We must therefore look for these children in children's courts and institutions for mental defectives.

Professor Wimmer divides the chronic forms of encephalitis into three main groups: chronic encephalitic Parkinsonianism, intermediary types, and extrapyramidal hyperkinesia. He discusses these types very fully, and with copious reference to the experience of other authorities. His own cases are fully described and illustrated by photographs and photomicrographs. The differential diagnosis is discussed in a very full and comprehensive manner, and illustrated by cases. Dr. Wimmer notes that an extremely persistent and painful symptom met with in chronic encephalitis, in children as well as in adults, is insomnia or dyssomnia. He attaches some importance to the examination of the spinal fluid of cases of chronic encephalitis, especially as a means of distinguishing them from pure neurasthenic or hysterical conditions, for the functional neurosis may, of course, be combined with the organic affection. He discusses the value of an increase of sugar in the cerebro-spinal fluid, although in eight chronic cases the results were quite negative. "Theoretically, an increase of the sugar content in the blood and cerebro-spinal fluid should be very interesting, seeing that it might be due to a lesion of the central sympathetic centres in the hypothalamic region." He relates a number of experiments carried out in collaboration with Dr. Jensen, but states the results tentatively, I am, indeed, inclined to think that the evidence of successful inoculation of rabbits is at present insufficient. The results of an exhaustive histological examination of the brain in non-experimented domestic rabbits at the Rockefeller Institute, in which lesions were found similar to those observed in animals that had been inoculated, tend to throw doubt upon the morbid changes seen in rabbits' brains and attributed to the inoculation. Professor Wimmer does not refer to the important experimental investigations by Mackintosh, for the reason previously stated, but he mentions those of Levaditi and Doerr, who by inoculation of virus obtained from human cases provoked in rabbits and monkeys brain lesions indistinguishable from those characteristic of lethargic encephalitis.

The histological changes in the cases which came under his own observation and died in hospital are fully described and illustrated by the author. The morbid changes are found especially to involve the basal ganglia and the mesencephalon, but any part of the central nervous system may be the seat of the inflammatory process. It resembles poliomyelitis in its epidemiology, low degree of infectivity, and prodromal symptoms, but in one important respect it differs—namely, only rarely is the spinal cord affected.

It is difficult to understand why the virus should select the mesencephalon, unless it be due to some special relation between the lymphatics that pass up along the vertebral arteries to supply the base of the brain and the localization of the virus in the naso-pharynx. A study of the course

[1] *Chronic Epidemic Encephalitis.* By August Wimmer, M.D. With Preface by Sir F. W. Mott, K.B.E., LL.D.Edin., M.D., F.R.C.P.Lond., F.R.S. London: William Heinemann (Medical Books), Ltd. 1924. (Super roy. 8vo, pp. 335, 85 figures, 1 plate. 21s. net.)

and relations of the lymphatics of the naso pharynx and the brain would be of interest It seems that the perivascular lymphatics of the short terminal perforating arteries that spring from the basilar artery and the circle of Willis are special seats of the activity of the virus, causing a peri vascular lymphocyte infiltration and congestion of the vessels so that to the naked eye an appearance of punctiform haemorrhages in the brain stem is seen, and is almost pathognomonic of the disease A similar perivascular infiltration is observed in the encephalitis of sleeping sickness due to the trypanosome invasion of the central nervous system So far no organism has been found in lethargic encephalitis, it is probably a filter passer

Unlike syphilitic and tuberculous brain affections there is little or no meningitis The absence of affection of the meninges probably accounts for the relatively fewer cells in the cerebro-spinal fluid in lethargic encephalitis

The pathogenesis of the disease is dealt with in a very interesting chapter, in which the author refers to the opinions expressed by a number of authorities The chapter on patho-physiological mechanisms is very instructive as it help to explain the various characteristic symptoms—for example the Parkinsonian syndrome the choreiform and athetoid movements, and the myoclonias—which occur in the chronic form of lethargic encephalitis Very extensive references are made to German and French authors and the book, both on account of the experience and knowledge of the disease displayed by the author and his familiarity with the important contributions to the subject by authorities on the European continent should ensure its wide circulation among English speaking people It is written in excellent English, and admirably illustrated by numbers of photographs and photomicrographs

FREDERICK W MOTT

POPULAR WORKS ON DIABETES

It is well known that the American public is more interested in health and the prevention of disease than is the British and one result of this interest is the existence in America of a large amount of good popular health literature written by responsible persons This fact is illustrated by the appearance on our table for review of no fewer than five short books on diabetes published recently in the United States written not only for the use of physicians but also for the instruction of nurses and patients

Diabetes is a disease which has caught the imagination of the American public Its incidence has increased considerably in recent years, it attacks the well-to-do more frequently than the poor—the popular vices of overeating and lack of exercise are believed to be important contributory causes and finally, the discovery of insulin was the most dramatic advance made by medicine in this century These facts, together with the existence of a diabetic club in America numbering a million members, have apparently created an extensive demand for popular literature on diabetes

The third edition of *Diabetic Manual for the Mutual Use of Doctor and Patient*,[1] by Dr ELLIOTT P JOSLIN, Clinical Professor of Medicine at Harvard Medical School, is a volume of just over 200 pages, which can be recommended with confidence to both of the classes for which it is intended It is written in a remarkably pleasant and interesting style and presents all the salient facts about the treatment of diabetes with clearness and precision Full instructions as to the selection of diets are given, the fundamental principles of food values are explained, and a large number of diabetic recipes and menus are given The main principles regarding the administration of insulin and the dose to be used are also outlined One word of caution is needed regarding the use in this country of the tables given in the book the American pint contains only sixteen fluid ounces, and therefore is only four-fifths of the English pint This difference might lead to error, although the chances of such an error occurring are reduced because most of the tables are given in the metric system This caution also applies to the other four books under review

As regards prevention of diabetes, Professor Joslin emphasizes the necessity of moderate eating and regular exercise He points out that the onset of diabetes is closely associated with obesity, and consider that 'no other condition rivals obesity in importance as a forerunner of diabetes" Various pieces of evidence in support of this thesis are quoted, but perhaps the most significant is that the mortality from diabetes fell about 50 per cent in Germany during the later years of the war when undernutrition became prevalent

Management of Diabetes,[2] by Dr GEORGE A HARROP JR is a manual for physicians and nurses based upon a course of instruction given at the Presbyterian Hospital, New York The generosity of John D Rockefeller made it possible to demonstrate the use of insulin to nearly six hundred physicians at this hospital and the book under review was prepared as a manual of reference for the use of the physicians after completion of the course The manual contains less than 200 pages, but gives in simple and concise language full instructions as to the treatment of diabetes by dietary management and insulin The book is intended primarily for physicians and nurses but it is written so clearly and simply that much of it could be read with profit by intelligent patients

The second edition of *Diabetes A Handbook for Physicians and their Patients*[4] by Dr PHILIP HOPOVITZ is another short book containing about 200 pages and covering much the same ground as the two others already mentioned It gives all the essential facts regarding diabetic treatment but we did not find it quite so easy to read as the others and we doubt whether patients would find it as clear as the books previously mentioned

Diabetes Its Treatment by Insulin and Diet[5] by Dr ORLANDO H PETTY Professor of Diseases of Metabolism of the Graduate School of Medicine University of Pennsylvania is a volume of 100 pages and is written with the idea of assisting the physician by giving his patient a working knowledge of the treatment of diabetes The author explains in very simple and clear language the nature of diabetes and the elementary principles of food composition and of the selection of a diabetic diet He gives also a short account of how to test urine for sugar and how to administer insulin

Food for the Diabetic[6] by Mrs M P HUDDLESON described as a consulting dietitian, has an introduction by Dr N B FOSTER Assistant Professor of Medicine at Cornell University Medical School, it gives full directions to the diabetic on how to plan a menu and how to measure out and cook the food The volume only contains 75 pages, but gives the diabetic just the information needed for the selection and preparation of meals

Taken as a whole these five volumes represent an interesting attempt to get health knowledge of a particular type across from the profession to the public and it is interesting to note that distinguished physicians do not think that it is beneath their dignity to do such work This attitude is not confined to the special instance of diabetes for there is in existence in America a mass of popular health literature written by authoritative persons which has little counterpart in this country

Such literature must be of great service in helping to create an informed public opinion concerning the science of medicine, and thus combating the quacks and various 'anti" faddists that are the natural opponents of science in general and of medical science in particular Dr Joslin for example takes particular care to emphasize in his books the personal obligation of every diabetic to scientific experiments conducted on living animals

PLANT ALKALOIDS

THE appearance of the second edition of *The Plant Alkaloids*,[7] by Dr T A HENRY, the director of the Wellcome Chemical Research Laboratories, is an event of importance for all interested in this branch of chemistry The first edition, which appeared in 1914, is the standard English work on this subject, since that date a large amount of progress has been made, and hence the new edition has been largely rewritten

The chemistry of the alkaloids is a complex and difficult branch of organic chemistry, there is indeed no clear definition of the term "alkaloid," and no one has yet devised a satisfactory classification for these substances The author defines the term "alkaloid" "as meaning a relatively complex basic substance occurring naturally and possessing some physiological action," and for the purpose of the textbook he divides alkaloids into nine groups, according to the nature of their nucleus, with a tenth group for alkaloids of unknown constitution, this arrangement, he says, is "convenient but unnatural"

Many hundreds of alkaloids are described, and in the case of the more important the following points are dealt with natural sources, sources of commercial supply, chemical and physical properties, tests for identification, structural formulæ, methods of synthesis, methods of preparing alkaloidal derivatives, and pharmacological action From this summary the wide range of the book may be gathered It is primarily a work of reference for organic chemists and for those dealing with alkaloids in commerce

Much of the information given is of a kind that would be very difficult to find elsewhere—for example, the author describes the commercial sources of many of the most important alkaloids The cocaine traffic has roused so much public interest of late that it is interesting to note what is said about the supply of this drug There are four chief sources—Bolivia, Peru, Ceylon, and Java The leaves of the first three contain cocaine as their chief alkaloid, the Java leaf contains chiefly cinnamylcocaine, but little or no cocaine The alkaloids from the Java leaves require chemical treatment to convert them into cocaine, the process is carried out chiefly in Germany This does not seem to exhaust the possible source of supply of cocaine, for the genus Erythroxylon, which yields cocaine alkaloids, comprises about eighty species, which are indigenous in four continents, and of all these only four or five have been completely examined as regards alkaloidal contents The commercial supply comes from at least three distinct species These facts indicate that the suggested control of the cocaine trade by means of the restriction of the production of coca leaves may prove a good deal more difficult than would appear at first sight

The author has devoted especial attention in the new edition to the evidence available correlating the chemical constitution of alkaloids with their pharmacological action, but he is forced to conclude that in spite of the large amount of work that has been done on this subject the results are very meagre The work done on the mydriatic and local anæsthetic properties of the tropeines (cocaine, atropine, and their allies) is described at some length This group has been studied with more care than almost any other, but the general conclusion is disappointing—"no generalization as to the relation between the mydriatic action and chemical constitution of the tropeines can be made at present which will explain the observed facts"

In conclusion it may be mentioned that the book has been brought completely up to date, and contains information concerning such recent discoveries as the nature and action of the quinine derivatives discovered by Morgenroth (optochin, vuzin, etc), and the ergot alkaloid ergotamine prepared by Spiro and Stoll

Enough has been said to indicate the large amount of information contained in this volume, much of it has been derived from very widely scattered sources and would be difficult to find in a concise form anywhere else The book will be found invaluable by all whose work involves the study or preparation of alkaloids

THE COLLECTED WORKS OF PASTEUR

THE third volume[8] of the collected works of Pasteur has been issued in Paris The edition is beautifully printed on large paper, and the illustrations are well reproduced It is edited by Pasteur's grandson, Dr VALLERY-RADOT, physician to the Paris hospitals, and is a model of what such a collected edition should be Pasteur's own text has been followed, except that obvious printer's errors have been corrected, and bibliographical references have been verified and emended if necessary When Pasteur published a similar paper in several periodicals variations are indicated in footnotes, or where this has not been found expedient each different version is given This third volume is entirely concerned with vinegar and wine, researches in the course of which Pasteur laid the foundations which presently led him on to the study of disease in man and animals As Dr Vallery-Radot remarks in his preface, this volume displays at once the precision of Pasteur's scientific investigations and his readiness to point out their practical application

NOTES ON BOOKS

DR JOHN L KANTOR'S handbook on *The Treatment of the Common Disorders of Digestion*[9] is somewhat out of the common, and contains a great deal of very practical simple advice as regards the general management of a class of cases with which every medical man has constantly to deal The chief subjects discussed are the general management of functional digestive disorders, ptosis, gastric irritation, ulcer, constipation and diarrhœa, achylia gastrica, and gall bladder disease—all conditions which require careful and sane handling In his introductory chapter Dr Kantor discusses prophylaxis, and traces much of the dyspepsia of adults to faulty dieting during childhood He is not obsessed with the value of drugs, and considers that such things as appetizers, tonics, predigested foods, and intestinal antiseptics can be almost entirely dispensed with He uses only a few simple drugs, and relies in the main upon diet, physical therapy, and hydrotherapy He suggests, however, that many of the good effects of spa treatment are due as much to the wetness as to any other quality of the waters consumed The chapter on ptosis and the asthenic state contains a very lucid account of the treatment recommended The author is opposed to operative procedures, and is of opinion that asthenics as such should not be operated on The book contains a number of illustrations, most of them radiographic, they are very good and beautifully produced They dramatically set out the value of radiography in the exact diagnosis of conditions the nature of which, before the radiographic era, was almost entirely conjectural The conclusion is that the rational treatment of gastric disorders cannot be carried out in the absence of an *x* ray examination

DR PAUL KAMMERER'S little book on *Rejuvenation*[10] is a popular exposition of the Steinach operation on men and animals The indications and limitations of the method are set forth, and several photographs are given of men and animals before and after the operation The cases in which successful results have been obtained are classified in six groups according as physical strength has been improved, mental activity restored, the activity of the senses regained or improved, arterio-sclerotic conditions and high blood pressure alleviated, premature old age or actual senility deferred, and mental depression relieved A short bibliography is appended.

PROFESSOR G H ROGER'S work on medical biology[11] consists of seven lectures delivered in the course of an official visit to the medical faculties of Brazil, the Argentine, Chile, and Uruguay The subjects discussed are the internal functions of the lung and its action on fats, the normal and pathological physiology of the lung, the cardio-vascular action of certain organic extracts, experiments on the suprarenals, the action

of the liver on poisons, the action of ferments and the functions of the bile. The book, which contains an account of experiments carried out by Professor Roger and his pupils, will be of interest to both the physiologist and the clinician.

PREPARATIONS AND APPLIANCES

Kaolin

Kaolin possesses marked powers of adsorption. It has been used medicinally in Central Europe for the treatment of intestinal complaints for many years, attention has been directed to its value more particularly in recent years. It appears to exert a power of selective adsorption on certain toxins, particularly those of cholera and dysentery. Its mechanical action on the surfaces is stated to be favourable. Since the adsorptive power is a function of the surface of its particles, its activity depends on the degree of fineness. Osmo kaolin, which is manufactured by Messrs. Allen and Hanburys, consists of the finest particles separable from china clay; it is prepared by electric treatment of an aqueous suspension of the clay. A sample submitted to analysis has been found to possess a very high degree of fineness, yielding with water a permanent suspension; its adsorptive property is indicated by the power of wholly decolorizing a solution of methylene blue when only 5 grams is shaken with 25 c.cm. of an aqueous solution containing 0·25 per cent. of the dye. The sample contained no organic or mineral impurity. It appears that kaolin may frequently prove useful in disease attended by diarrhœa.

THE MEDICAL DEFENCE UNION

ANNUAL MEETING

Report of Council and Solicitors' Report

THE Medical Defence Union, Limited, held its annual general meeting on September 25th at Brighton. Steps have been taken to extend the benefits of membership to practitioners in the Irish Free State, Northern Ireland, the Channel Islands and the Isle of Man. The standing joint committee, consisting of four representatives of the Union and four of the London and Counties Medical Protection Society, has continued to co-ordinate the work of the two bodies although each body retains its entire independence. Considerations arising out of the astounding damages awarded in the first instance in the Harnett case led the two societies to decide to afford their members unlimited cover in respect of damages or costs of the other side. The report gives some examples of the variety of cases which come before the council for advice or further action. In one case a local inspector of taxes sought to assess a member upon the rateable value of a house which he occupied rent free in virtue of his office as medical superintendent of one of the hospitals of the Metropolitan Asylums Board. An appeal was lodged by the council against the assessment and the decision of the special commissioners was to the effect that the beneficial occupation of a house in such circumstances was not an emolument within the meaning of the Finance Acts, and accordingly the assessment was discharged. The report points out that this decision does not affect the liability of resident medical officers in certain of the hospitals to be assessed for income tax upon any monetary allowance they may receive specifically in lieu of quarters. The council has appealed against the refusal of an inspector of taxes to allow a deduction for subscription to medical societies in a case in which the assessment is under Schedule E, when the assessment is under Schedule D this deduction is usually allowed. The report states that an unusually large number of cases of unqualified practice have been investigated during the year, but in the majority it was impossible to obtain sufficient evidence to justify proceedings. In one case a conviction was obtained and the maximum penalty imposed; another case was dealt with under the Probation of Offenders Act, and in a third case the summons was withdrawn on part payment of costs and an undertaking not to repeat the offence.

The solicitors to the Union (Messrs. Hempson) in a report which is appended to that of the council refer to the frequency with which the failure of a practitioner to have an x-ray photograph taken in a case of fracture or dislocation has been raised in an allegation of negligence. They urge that any member of the profession who advice is rejected should take steps to place on record that the advice was given and disregarded; there should at least be no difficulty in writing a letter to the patient repeating the advice given, and retaining a copy or the letter. Comments are made upon the informal character of inquiries before Medical Service Subcommittees, where rules of evidence are not observed and hearsay evidence is accepted without hesitation. The insurance regulations do not permit a practitioner to be represented at such inquiries, but the council can advise members on the preparation of their case. The solicitors furnish some interesting figures, showing among other things the average cost to the Union of the defence of its members in seventy-three of the heavier cases occurring during the last fifteen years. The total cost of these seventy-three cases was £17,034, an average of £234.

President's Address in Radiology on Injuries to the Limbs

The chair was taken at the meeting by the President, Mr. Walter G. Spencer, O.B.E., F.R.C.S., who in moving the adoption of the annual report congratulated the members upon the satisfactory position occupied by the Union. Already the number of new members elected in the nine months of the current year (over 1,200) exceeded that of the whole of any previous year, and the roll of members *now reached a total of over 11,200. Recent events had led the council after consultation with the London and* Counties Medical Protection Society to provide members with unlimited indemnity against damages and costs of the other side on the same conditions as had previously prevailed and without any increase in the annual subscription to the Union. Unfortunately quite a number of medical practitioners within the area covered by the Union were still completely unprotected against the attacks of unscrupulous persons. Even in Brighton less than 50 per cent. of the registered medical practitioners had joined the Medical Defence Union. Membership of the Union ensured that the great majority of frivolous attacks against medical practitioners were at once arrested, always provided that the member did not rashly commit himself by act, speech or letter in the first instance but at once applied to the Union for advice and help. It was necessary to emphasize and repeat the warning so frequently given that an x-ray photograph should be taken as soon as it could be done after any accident in which there was a possibility, however remote, that a fracture or dislocation might have occurred. When, for any reason, some delay was unavoidable in arranging for the photograph a record should be made in writing, for the signature of the patient or his representative. Mr. Spencer referred in feeling terms to the death of Sir John Tweedy, a former president and Dr. J. Poche Lynch and Dr. A. C. Pope, former members of the council and also to the loss which the Union had sustained through the retirement of Dr. M. Hallwright from the council owing to ill health. He congratulated the Union on the efficient services rendered to the Union by the General Secretary and his clerical staff.

The annual report of the council and the financial statement for the year 1923 were adopted unanimously. Sir Charles Ballance, K.C.M.G., C.B., M.V.O., Dr. E. C. Greenwood and Dr. W. S. A. Griffith were unanimously re-elected members of the council.

EXTRAORDINARY GENERAL MEETING

At the conclusion of the annual general meeting an extraordinary general meeting was held when proposals submitted by the council for alteration of the Articles of Association were unanimously adopted. Some objection was raised by Dr. I. Feldman, who pointed on behalf of several members to the proposed new Article 33a which provided that the council should have an absolute discretion as to the giving or withholding of the indemnity against damages and costs of the other side in unsuccessful actions, and empowered the council to provide such complete or partial indemnity as the council should in its discretion think fit. After hearing explanations from Dr. Feldman and several members of the council Dr. Feldman expressed himself as completely satisfied that the proposed new Article was suggested in the best interests of the members, and accordingly voted for its adoption.

British Medical Journal.

CANCER OF THE BREAST AND ITS SURGICAL TREATMENT

Last May the Departmental Committee of the Ministry of Health dealing with cancer issued a memorandum on the results of operation for cancer of the breast [1] Such a statement of the position was needed from the public point of view, but the excellent results claimed occasioned some surprise amongst not a few medical men, and may even have been met with a certain amount of incredulity The Committee has now issued a very full report [2] on the subject, containing an analysis of the data on which the memorandum was founded, and a critical survey of this report ought to convince even the most sceptical that the effectiveness of operation is considerable An immense amount of labour has been spent on its preparation by the author, Dr Janet E Lane Claypon, who has been guided in the statistical investigations by Dr Major Greenwood Close on 20,000 cases have been analysed, culled from numerous articles published in practically every country in Europe, including this country, and also in America It is believed that no important paper containing series of operated cases was missed Owing to the want of uniformity in the systems of grouping of cases by the original authors much careful study was necessary in order to place a large number of cases on a similar basis for purposes of comparison, for until this was done no reliable statement could be made regarding the increased expectation of life following operation

The duration of life after operation depends on several factors, the most important being the stage of the disease at the time of operation and the method employed by the surgeon Dr Lane Claypon traces the development of the operative treatment, which has increased in complexity and effectiveness in correspondence with the improvements in surgical technique and knowledge of the modes of dissemination she shows how the operation mortality, which stood at about 15 per cent forty years ago, is now practically negligible For the purposes of analyses of published results the operations were grouped as "complete" and "incomplete"—the former including such methods as ensured removal of the whole breast, axillary contents, and pectoral muscles, with varying degrees of skin and fascia, and the latter those in which the organ and axillary contents, and, at most, some fibres of the pectoral muscle, were removed Very advanced procedures, such as the operations of Halsted and others, mostly reserved for late cases, did not in the mass show any improvement over the less complete The author states that it is generally admitted that operative procedures have reached their limit and cannot be advantageously extended, so that until some other method of cure is discovered efforts must be directed towards securing operation at as early a stage as possible It is well, then, to have as accurate an estimate as may be possible of the results of our present operative methods

In the consideration of the material furnished by the reports of surgeons those cases were excluded entirely which failed to be traced for the full period after operation, as were also those cases in which it was known in advance that complete removal of the growth was impossible, whilst all those dying before the expiry of the time, whether from operation, accident, or other disease, were reckoned as having died of cancer On that basis it can be justly maintained that the statistical method adopted underestimates the real claims There is no general agreement as to the length of time which should elapse before a patient may be regarded as cured, and for that reason the term "cure" has been omitted those who died were regarded as having succumbed to the risk of death, and those who lived for the allotted period were regarded as having survived the risk independently of their physical state at the conclusion of the period of risk This must not be taken to imply, as some have done, that the patient has no signs of recurrence at the end of the period As most of the original authors have reported their cases at the end of a three years' period, this has been the time chosen to arrive at a basis of average results Naturally, the longer the period the more the difficulty in tracing patients and the greater the losses from recurrence must be The figures, then, show that following the older or "incomplete" operation, out of a net total of 7,029 patients, 2,956, or 29 2 per cent, were alive at the end of three years after operation, and that after the modern or "complete" operation, out of a net total of 8,921 patients, 3,857, or 43 2 per cent, were alive This by itself is sufficient evidence of the greater value of the complete operation, but there is the further consideration that under modern methods many more cases in an advanced stage come within the scope of operation than formerly, for the risk of death from operation, even with the most extensive operative procedures, is negligible the results of complete operations are thus heavily weighted with the deaths due to the inclusion of this category An examination of the available material did not lend any support to the opinion that the end results among private patients surpassed those of the hospital class

The more recent writers have chosen a five years' period as a better index of the worth of an operative measure, but the numbers of cases so reported are perhaps too small as yet to give us exact indications It was found that there were great variations in the end results reported, and no adequate explanation of this variation could be given, although it is evident that the inclusion of only a few very advanced cases would seriously affect the percentages, taking the average of all the cases analysed (numbering 2,441), 33 1 per cent survived the five years' test Beyond this time the amount of material was too scanty to allow of reliable statistics Attention is, however, drawn to unpublished statistics by Dr Wyard of the Cancer Hospital, who traced the fate of 278 cases which had been operated upon there more than nine years previously, he found that 42 (or 16 9 per cent) were alive and well This is too severe a test, however, as many might have been expected to succumb from risks other than cancer As Dr Lane Claypon mentions, there is a belief held by some surgeons that metastases as a post operative cause of death are increasing under the modern methods, while local recurrences are decreasing, and a fear has been expressed by a few that the extensive operations practised are responsible for the metastases There seems, however, to be little foundation for these suspicions The statistics show that under the incomplete opera-

[1] British Medical Journal, May 24th 1924, p 924

[2] *Cancer of the Breast and its Surgical Treatment A Review of the Literature* By Janet E Lane Claypon, M D, D Sc Ministry of Health Report 28 H M Stationery Office or through any bookseller Price 2s 6d net

tion 92 95 per cent of recurrences took place within the five years of operation is contrasted with 87 8 per cent under the complete operation Taking into account the fact that the cases submitted to operation now days are more serious than formerly it is evident that there is a not inconsiderable prolongation of life due to modern operations At the present time the majority of the patients ultimately dying pass the first year of operation whereas only about one in three did so formerly The percentages of the various countries showed a remarkable agreement on the point Whilst the available evidence does not imply that there has been any increase in the actual formation of metastases it probably denotes that owing to the reduction in recurrences and the consequent prolongation of life more time is available for a greater development of metastases than formerly An attempt to correlate the prognosis after operation with the histological variety of the carcinoma did not give information of any value and the classification of types of carcinoma adopted by certain surgeons and by descriptive pathologists of the older school is now generally abandoned

The stage of the disease when operation is performed is of supreme importance in determining the result and it is the careful analysis of papers from this point of view which makes this report so valuable It was found possible to group the cases into three classes according to Steinthal's classification—namely (1) where the tumour was small and not adherent to the skin and not more than one or two axillary glands were found infected at operation (2) where the skin was adherent to a moderate sized growth and the axillary glands were palpable and (3) where most of the mammary gland was involved and the tumour was adherent to skin and deep fascia whilst the supraclavicular glands were often involved When they were thus grouped it was found that after the complete operation the percentage of survivors at three or more years was from 65 to 80 when the disease was still local in the second group the percentage was about 30 and in the third group only some 8 or 9 per cent survived as long as three years after operation Thus if a patient be operated upon at the early stage by modern methods her chances are 12 in 15 if she waits until the disease has spread her chances by complete operation fall to 5 in 15 and by incomplete to less than 3 in 15 whilst in the later stages the chances are about 1 5 in 15 for either kind of operation When the supraclavicular glands are involved 7 7 per cent survive three years and 3 per cent for five years

A chapter is devoted to the very vexed question of precancerous conditions the liability of benign growths to become malignant the relation of chronic mastitis to true cancer and the dangers supposed to arise from exploratory operations but the statements are mainly quotations from American authors and are not in general accepted The author's summing up that it can hardly be doubted that operation in the precancerous stage would rob cancer of the breast of most of its dangers and the percentage of cures would be greatly increased is not on the same high level as the other conclusions built on more solid data However we may repeat for what it is worth the estimate of McCarty made on his experience at the Mayo Clinic to the effect that if all clinical operation be performed on clinically doubtful cases 1 in 20 breast will be removed unnecessarily whilst if they are dealt with as benign 1 in 10 fails to be removed when it should be

A consideration of reported cases revealed nothing more clear suggestive from the point of view of etiology, but the accurate information obtained on several points should dispel numerous errors that have gained wide currency The social status of the patients has no influence on the average age of onset of the disease there is no inherently greater malignancy in cancer among young persons than amongst the older married women are not more prone to cancer of the breast than single (in fact the single have a slightly higher risk) neither child bearing nor faults of lactation have any evident bearing on its incidence there is no appreciable difference between the two breasts as regards the frequency with which they are affected by cancer These conclusions and several others are amply supported by the statistics given

There is an interesting chapter on the expectation of life after operation which is stimulating and suggestive and may be commended as a study in what might be called speculative statistics Left without operation a patient say at the age of 50 has an expectation of 3½ years of life from the date of the first sign of the disease if she is subjected to complete operation without distinction of the stages of the disease her expectation is increased to 6 years and 8 months but if the operation be performed early this expectation is almost doubled A table is given admittedly based on slender data showing the average number that may be expected to survive up to ten years after operation

Such a brief summary as this gives a feeble indication of the amount of evidence collected and ably analysed by Dr Lane Claypon and we can be sure that her thorough work will be appreciated not only by surgeons but by all medical men who read her exhaustive report

TECHNICALISM

A WRITER in a recent issue of one of the big monthlies exercised about some unfortunate words—words that is badly constructed or improperly applied—was point enough to admit that a good deal of pains has been taken to form new medical words with due regard to etymological propriety He went on however to imply that too many new medical terms were invented and even to insinuate that they were devised to mystify the public by a suggestion of knowledge more profound than we really possess or with the deliberate intention of concealing the truth from the layman There is just enough basis for the second allegation to make it impossible to deny it altogether A doctor is not on his oath always to tell the whole truth to every one who consults him He has to treat the patient as well as the disease there are occasions when it is wiser to speak of blood poisoning than to blurt out syphilis Sometimes a patient or his friends while professing a desire to know the truth dread in their hearts to be told the whole There is a story of two fashionable physicians of the last century who met in consultation on a distinguished patient in a late stage of Bright's disease the first physician in talking with the wife avoided naming the disease or giving a prognosis The wife appealed to the consultant

Now she said you will tell me the truth I shall know what is really the matter with him

Madam was the reply your husband is suffering from cachexia and the liars are satisfied She was read to catch at straws and a straw was held out to her

But the suggestions that new medical terms beyond necessity are accepted in medical literature or that there is a secret language of disease, are fallacies

urges that all works published by scientific journals should be preceded by abstracts, drafted for preference by the authors themselves, in conformity with precise rules The abstracts should indicate briefly the conclusions of the article, the results obtained, and statistics of general importance, including everything which may be of use in drawing up a manual or table of constants Experience has shown that the proper length of an abstract is from 4 to 8 per cent of the length of the article It is also urged that the publications of learned societies, if in a language other than one of the principal European languages, should contain summaries in one of the more widely spoken tongues Another task which has been undertaken is the compilation of a list of the most important books printed throughout the world This list is to be at the disposal of a public of average culture which has hitherto been unable, by force of circumstances, to obtain information concerning intellectual production in foreign lands Recommendations have also been made to the several States with regard to the interchange of professors and the granting of travelling facilities and scholarships to groups of students and professors and men of letters going abroad for some specific scientific purpose The Spanish Government has made proposals with regard to the equivalence of degrees and the co-ordination of studies in the universities this project is favoured by the committee, but the difficulties in its way are considerable The committee proposes to publish information concerning the methods of teaching in the various countries All these proposals were approved by the Assembly, but a more contentious matter was raised by an offer of the French Government to found an Institute of Intellectual Co-operation in Paris the institute to be absolutely international in its programme and choice of staff, and its administration to be entrusted to the League Delegates from Poland and elsewhere warmly acclaimed the French offer and the Belgian delegate emphasized the historic contribution of France to the ideals of intellectual co-operation, which were found embodied in the *Nouvelle Atlantide* of Condorcet as far back as 1793 Some voices, however, were raised against the proposal, on the ground that an institute in Paris would suggest that France had a monopoly of culture, and that it would be undignified for the League to include in institute which depended for its existence upon credits voted by one particular parliament An Australian representative strongly urged that an institute of the kind should be founded in Geneva and supported by appropriations from the funds of the League In the end, however, the offer of the French Government was accepted with something like unanimity It may be added that the whole work of the Institute of Intellectual Co-operation involves a contribution from the people of Great Britain, France, and the other countries which furnish the principal financial support to the League, amounting to about one half-penny per head of population per century

WORKMEN'S COMPENSATION IN FRANCE

LEGISLATION with regard to workmen's compensation has followed a different course in France from that in this country Prior to the law of 1898 a workman in France who sought compensation for an injury had to bring an action, and had to prove not only the existence of the disablement, but also that the employer was at fault, as this was held to be the sole ground upon which the latter could be held responsible In arriving at a decision the court was mainly concerned in looking for a fault on the part of the employer, and the sphere of the medical man was strictly limited The old law was productive of much hardship, and led to discontent on both sides The law of 1898 laid down a new principle—that the claim to indemnification flows from the professional risk and not from the fault of the employer As a corollary it followed that part of the risk properly falls on the workman, and total indemnification, such as was awarded prior to 1898, was abolished An examination into the statistics of accidents showed that their causes could be classified under five headings (1) the fault of the employer, (2) the fault of the workman, (3) mischance (bursting of boiler, etc.), (4) *force majeure* (floods, storms, etc.), and (5) unknown It was further ascertained that of a hundred accidents one-quarter were due to the fault of the employer, one quarter to the fault of the workman, and one half to the three other causes It was decided, therefore, that in order to distribute the burden equitably the employer should be held responsible, on the average, only for those accidents which were due to his fault and one half of those for which neither he nor the workman could be blamed—that is, the employer was made responsible for 50 per cent of the total Taking its stand on these principles, the French Legislature has accorded the disabled workman pecuniary reparation corresponding to one-half of the disablement suffered in the case of partial incapacity, and to two-thirds in the case of total incapacity The actual amount payable is calculated simply by comparing the salary before the accident with that obtainable after it Litigation tends to centre, not round the fault of the employer, but round such questions as estimation of the gravity of the accident and the nature and degree of incapacity resulting from it—questions of a medical character Professors Forgue and Jeanbrau have recently published a book[1] to assist medical men in the performance of their duties under the French law, the authors have not only explained the formalities to be followed, but have written a complete system of the pathology of accidents, which will be of service to medical men of whatever nationality

MENTALLY DEFECTIVE CHILDREN

THE Board of Education has issued a circular (1331, September 12th, 1924) to local education authorities regarding the care of mentally defective children The Mental Deficiency Act of 1913 and the Elementary Education (Defective and Epileptic Children) Act of 1914, following on the permissive Act of 1899, contemplated that local education authorities would obtain particulars of all the mentally defective children in their areas and make arrangements with a view to the selection of children suitable for education in special schools and the notification of those judged non-educable to the mental deficiency committee of the county or county borough council The war and consequent difficulties of finance and building prevented the establishment of sufficient special schools to meet the need The Board has therefore been in consultation with the principal associations of authorities, officials, teachers, and voluntary workers with a view to devising methods of dealing with these children under existing conditions Local authorities are urged to ascertain without delay the extent of the need in each area Children in attendance at special schools should be passed periodically under review in order that suitable cases may either be returned to the ordinary school or notified to the mental deficiency committee in accordance with the Mental Deficiency (Notification of Children) Regulations, 1914 In the case of mentally defective children who are suitable for admission to special schools, but for whom at the moment no such school is available, and especially for those who are in no school at all, the local authorities' arrangements should include the supervision of the children by means of home visits, whether by school nurses, care

[1] *Guide pratique du Médecin dans les Accidents du Travail* Suivi Médicales et Judiciaires Par E Forgue et E Jeanbrau Quatrième édition refondue avec la collaboration, pour la partie médicolégale, de O Crouzon Médecin de la Salpêtrière Paris Masson et Cie 1924 (Imp 16mo, pp xxiv + 840 Fr 40)

committee members, paid welfare workers or voluntary workers. The main objects of such supervision are to give advice to parents on the care of these children, and to provide means by which all cases are reviewed from time to time with a view to the notification of suitable cases to the mental deficiency committee. In this connexion special attention should be given to the cases of boys and girls of the ages of 14 and 15 years in order that the provisions of Article 5 of the Notification Regulations 1914 may be utilized in proper cases. Before making such a notification the local authority should obtain a report from the medical officer on the physical and mental condition of the child, also from the teacher on his progress and behaviour in school, and from the care committee on his home conditions. In the absence of special school provision it is considered that some of the higher grade mentally defective children may be accommodated in the classes held in ordinary schools for mentally retarded children. It is urged, however, that this should be regarded as a temporary arrangement, for there is risk to the mentally retarded that they may be deprived of their proper places in these classes, and it is impossible to continue the mentally defective in these classes after the age of 14 years. Constant and close co-operation between the local education authority and the mental deficiency committee is advised, and methods are suggested whereby this may be obtained. In some areas the chairmen of the special schools subcommittee and the mental deficiency committee are one and the same person; in some the education authority's certifying officer is also medical adviser to the mental deficiency committee; in others the co-ordinating influence is the local branch of the central association for mental welfare.

ROYAL COMMISSION ON LUNACY AND MENTAL DISORDER

THE first meetings of the Royal Commission on *Lunacy Law and Administration and Mental Disorder* will be held at the Royal Commission House, 5 Old Palace Yard, Westminster, S.W., on Tuesday, October 7th, and Wednesday, October 8th. On October 7th evidence will be given by the Board of Control and on October 8th by the Ministry of Health and the Lord Chancellor's Department. The Commission is instructed "(1) to inquire, as regards England and Wales, into the existing law and administrative machinery in connexion with the certification, detention and care of persons who are or are alleged to be of unsound mind; (2) to consider, as regards England and Wales, the extent to which provision is or should be made for the treatment without certification of persons suffering from mental disorder, and to make recommendations." The Commission is constituted as follows: The Right Hon. H. P. Macmillan, K.C., standing counsel to the Convention of Royal Burghs, Scotland (Chairman), Earl Russell, Lord Eustace Percy, M.P., Sir Thomas Hutchison, Bt., Director of the Commercial Bank of Scotland, and Lord Provost of Edinburgh 1921-23; Sir Humphry Rolleston, Bt., K.C.B., M.D., President of the Royal College of Physicians of London; Sir Ernest Hiley, K.B.E., at one time town clerk of Birmingham, and formerly M.P. for the Duddeston Division of that city; Sir David Drummond, C.B.E., M.D., Pro-Vice Chancellor of the University of Durham, and formerly President of the British Medical Association; Mr. W. A. Jowitt, K.C., M.P.; Mr. F. D. MacKinnon, K.C.; Mr. H. Snell, M.P., a member of the executive committee of the Fabian Society and formerly a lecturer for that society; Mrs. C. J. Matthew and Miss Madeline J. Symons of the Women's Section of the National Union of General Workers; with Mr. P. Baxter of the Ministry of Health, as secretary. All communications regarding the Commission should be addressed to "The Secretary, Royal Commission on Lunacy and Mental Disorder, Ministry of Health, Whitehall, S.W. 1."

WEST INDIA RED CROSS SOCIETY

THE West India Red Cross Society and the West India Committee are associated with the present Mansion House appeal for help for the sufferers in the Leeward Islands, which were recently devastated by a hurricane. At a meeting of the committee of the former society, held in London at the end of July, the honorary secretary, Dr. C. B. Mason, reported on the progress that was being made in establishing the society and in fulfilling its two objectives of reducing the high rate of infant mortality in the British West Indies, and of furthering the welfare of the local population. British West Indian labour, he said, had been extensively used in the construction of the Panama Canal, and 90 per cent. of the labourers had sent back their savings to the West Indies. The present high infantile mortality was destroying an undoubtedly valuable asset of the empire, and the society was therefore addressing itself to the task of remedying this. It is proposed to appeal next year to the British public for £10,000, the income of which will be used to help the societies working in the Windward and Leeward Islands. More British doctors are urgently needed, and also administrative improvements in the medical services of the various islands. In Barbados the prevention of such diseases as typhoid fever and tuberculosis is a serious problem, to be tackled by drainage reforms, improvements in housing, and the provision of better food. The activity of Sir Eustace Fiennes, the Governor of the Leeward Islands, in providing a new water reservoir in Antigua should have most beneficial results. Sir Eustace Fiennes referred to the urgent need for financial help, and paid a high tribute to the character of the planters and the West Indian inhabitants generally. The grant made by the West India Red Cross Society to the Antigua creche had been of great value. The Rockefeller Foundation also had provided for the services of two doctors in the Leeward Islands to combat the prevalent diseases, and generous help had been forthcoming from the people of the British Isles.

MEDICAL SOCIETY OF LONDON

THE Medical Society of London is now entering upon its 152nd year, and the syllabus for the first half of the session was issued this week. An attractive programme has been arranged. The annual general meeting will be held on Monday, October 13th, at 8 p.m., and immediately afterwards the new president, Dr. Eustace M. Callender, C.B.E., will give an address on "Medical memories." The meeting on October 27th will be a clinical evening. On November 10th a discussion on encephalitis lethargica will be opened by D. E. Farquhar Buzzard, who will be followed by Drs. A. J. Hall, J. McIntosh, and A. S. MacNalty. On November 19th, as already announced, Dr. Herbert Spencer will deliver his Lloyd Roberts Lecture on "The renaissance of midwifery." On November 24th a discussion on the treatment of senile gangrene will be introduced by Sir Anthony Bowlby, Bt., who will be followed by Dr. H. des Voeux and Mr. Sampson Handley. On December 8th Dr. George Graham and Professor H. Maclean will open a discussion on the present position of the treatment of diabetes by insulin. During February and March 1925, Sir Bernard Spilsbury will give the Lettsomian Lectures, on "Wounds and other injuries", the annual oration will be delivered in May by Sir William Hale-White, on "The medical career of John Keats."

THE Harveian Oration before the Royal College of Physicians of London will be delivered by Sir Archibald E. Garrod, K.C.M.G., M.D., F.R.S., Regius Professor of Medicine in the University of Oxford, on Saturday, October 18th, at 4 o'clock. Invitation cards may be had from the secretary of the College, Pall Mall East, S.W. 1.

BRITISH ORTHOPAEDIC ASSOCIATION'S VISIT TO BOLOGNA.

In the spring of last year the British Orthopaedic Association held a meeting at Leyden by the invitation of their corresponding member, Dr Mark Jansen, and afterwards at Amsterdam in conjunction with the Dutch Orthopaedic Association. The opportunities of professional study and enlightenment thus afforded, and the noble hospitality of our Dutch confreres, were so highly appreciated by the members that it was arranged this year to accept the invitation of Professor Putti of the Instituto Ortopedico Rizzoli of Bologna to hold a meeting in that city. Some fifty-one members and ladies and other guests attended the meeting, which took place on September 22nd and following days.

The institute, which was founded by the benevolence of Francesco Rizzoli, a surgeon of Bologna, after whom a street in the city has since been named, is splendidly housed in an old monastery situated in S. Michele in Bosco on a wooded spur of the Apennines just outside the city. This monastery has a long and interesting history. Founded in the twelfth century, it was afterwards used as a fortress, but from the fourteenth century it was a religious house of the Olivetan Fathers. Most of the present buildings, however, date from the sixteenth century. With the coming of the Republican French into Italy in 1797 and under the Napoleonic kingdom of Italy the monasteries were swept away, and since that time the buildings have not been used for monastic purposes, but in 1860 they were occupied as a villa by King Victor Emmanuel the Second.

The present institution was organized between the years 1897 and 1893. The buildings are of magnificent proportions, and many of the rooms are superbly decorated with frescoes. The long vaulted corridor on to which many of the monks' cells opened (they are now used as wards) is almost, if not quite, unrivalled in a building of this sort, for it is 526 feet in length and of great height and width, and from its windows splendid views are obtainable over the city of Bologna with its many towers, and of the Emilian plain. The church of the monastery has some fine frescoes, and is still used by the staff and ambulant patients and the inhabitants of the neighbourhood on Sundays and weekdays.

In the Aula Maggiore of the convent is a remarkably large and comprehensive collection of orthopaedic and other medical and surgical works. This room, of which a coloured print was presented to every visitor by Professor Putti, is a gem of Romanesque architecture, profusely decorated with frescoes whose wealth of colour is a delight to the eye. Besides the frescoes the buildings of the convent contain a number of oil-paintings and are also decorated with sculptures. For a full account of all the art treasures readers are referred to *The Story of Bologna*, by Alathea Wiel (London: J. M. Dent and Sons), a copy of which also was *presented by Professor Putti to each of the visitors*.

Congenital Dislocation of the Hip

On Monday, September 22nd, the members were conducted in special trams to the institute, where, after Professor Putti had cordially welcomed them, he read a report on the treatment of congenital dislocation of the hip. This deformity occurs with remarkable frequency in Northern Italy, as is shown by the fact that 450 cases were treated by Professor Putti and his assistants in the space of twelve months, while at Milan Professor Gallezzi treats at least 500 cases in a year. Very little is known of the causes of the deformity and no theory on the subject has yet been generally accepted. The usual disproportion in the sex incidence of the disease is noticeable in Italy as well as elsewhere. Professor Putti operates very early, under the age of two years if possible, by simple flexion and abduction and fixation in plaster, which always includes the knee and upper part of the leg. Open operation is reserved for cases in which the soft parts obstinately resist abduction and in which manipulation alone fails. Very interesting lantern slides of cases before treatment and after some years were exhibited, showing that although in almost every case a considerable restoration of the iliac roof of the acetabulum took place, it varied very greatly in degree and in very few cases was it anatomically complete, despite the excellent functional results. The statistics of results as recorded by the Italian Orthopaedic Association show 84 per cent. of cure in unilateral cases and 45 per cent. in double cases. Professor Putti demonstrated his method of reduction, which is extremely simple, on three cases, one of which was bilateral. The two unilateral cases were easily and quickly reduced, but one hip of the bilateral case could not be replaced, and Professor Putti stated that further attempts would be made after preliminary manipulations and massage, failing which he should probably perform an open operation. Special and ingenious tables were used for reduction and also for the application of plaster, and the quickness of the whole procedure, together with the excellent team work, much impressed the visitors.

After the demonstration in the operating theatre the wards were visited, where a number of children with corrected hips, whose first plaster had been removed, were seen exercising the joints themselves by means of a simple apparatus of cords and pulleys, each under the supervision of a nurse. This proceeding is, of course, intended to hasten the development of the joint while increasing its mobility, and at the same time it affords some exercise for the muscles of the upper extremities. After seeing other interesting cases the party had lunch as the guests of the Director in the charming garden of the Institute.

The Workshops of the Institute

After lunch a visit was made to the extensive workshops of the Institute, where every kind of instrument and appliance needed in orthopaedic surgery is manufactured, including a most ingenious table for the treatment of fractures and dislocations. Complicated and elaborate as this instrument appears to be, it had its primitive ancestor in the scamnum of Hippocrates, a specimen of which was only recently discovered by Mr. Thomson of the Wellcome Medical Museum, also in Northern Italy (see BRITISH MEDICAL JOURNAL, February 23rd, 1924). The product of these workshops are supplied to surgeons and hospitals throughout Italy, and to facilitate this a very complete and well illustrated catalogue is issued. The workmanship and the quality of the materials used appeared to be excellent.

Dinner

In the evening the official dinner of the association was held in the Hotel Baglioni, under the genial chairmanship of the president, Sir Robert Jones, when speeches and toasts were not so lengthy as to interfere with pleasant social intercourse.

On Tuesday, September 23rd, the theatre of the Institute was again visited, and the members had the great advantage of seeing Professor Putti perform three typical operations—namely, an arthroplasty of the knee for ankylosis, a tendon transfer for partial palsy of the foot and ankle muscles, and an open operation for obstinate congenital dislocation of the hip.

The operation of arthroplasty, with which Professor Putti's name is so closely connected, is already well known to surgeons, for it was described and illustrated in *La Chirurgia degli Organi di Movimento*, and also by him at the meeting of the International Society of Surgery in London last year, when some excellent results were shown; but the details of the technique can only be thoroughly appreciated by seeing the actual operation. The opportunity offered was much appreciated by the members, who had great pleasure in seeing such a real surgical artist at work. The technique and team work were of the first class.

Professor Putti tells us that he has operated on 200 cases, 60 of which were operations for stiff knees and the remainder for ankylosis of the lower jaw, the elbow, hip, ankle, and the smaller joints of the foot and of the fingers. Very great care is exercised in the selection of cases, only those cases of stiff knee in which a movable joint is really

necessity being submitted to operation The cases which were exhibited showed excellent results several years after the dates of operation The open operation for congenital dislocation of the hip was characterized by the impossibility (so important if shock is to be avoided) and perfection of technique which distinguished the operation of arthroplasty

THE UNIVERSITY OF BOLOGNA AND ITS MEDICAL SCHOOL

On the afternoon of the first day Professor Putti gave an address in the beautiful old anatomical theatre of the University building, the Archiginnasio, and described the origin of the University and of its medical school The theatre is panelled and ceiled in cedar and adorned with modern statues of famous teachers including Tagliacozzi, whose well known operation is typified by the fact that he holds a nose in his hand The professorial rostrum has a canopy supported by finely carved eighteenth century wooden anatomical figures of life size representing with great accuracy all the superficial muscles of the body as if the skin and fascia had been removed

Professor Putti said that the University of Bologna was the oldest in the world Although there was no precise information about its origin it was known that it began about the tenth century as a rhetorical and grammatical school Before the fifteenth century the University was known as the Studio and was at first a school of law which owing to the fame of its professors continued to be of international importance The students from each country were gathered together into nations each with its statutes number every country was under a deep obligation to those of its citizens who after studying at Bologna took home with them the light of learning that burnt there so brightly From very early days it was divided into two distinct bodies—the University of the Ultramontani consisting of students from land other than Italy (beyond the mountains) and the University of the Citramontani composed entirely of Italians Each had its own rector and was divided into many nations In the thirteenth century there were fourteen (Gaul Picardy Burgundy Poitou Touraine and Maine Normandy Catalonia Hungary Poland Germany Spain Provence England and Gascony) in the fourteenth century there were sixteen Among the masters of the law school was Irnerio whose disciple Vaccario is said to have been the first to carry into England a knowledge of Roman law He taught at Oxford and so sowed the seed out of which the University of Oxford sprang Francesco Accursio who at the end of the thirteenth century was invited by Edward I to go to Oxford was a son of a disciple of Azzone, another famous Bolognese teacher

The study of medicine seems to have arisen in Bologna out of the privilege accorded by the city to a famous Tuscan doctor Taddeo d'Alderotto about 1288 But it was only about 1316 that the university of medicine was recognized by the governing bodies both of the town and the Studio and allowed to nominate its own rector The most important chair of the medical school was then that of anatomy in which was included surgery The first to give lustre to this chair was Mondino dei Liuzzi who was teaching between the end of the thirteenth and the beginning of the fourteenth century He wrote a treatise on anatomy, which was the first of its kind and served as a textbook all over the world for at least two centuries Mondino's great merit was his insistence that anatomy should be studied not from the books of Avicenna or Galen as had been done for so many centuries but on the cadaver a method which since the school of Alexandria—1 600 years earlier—had not been followed Other names of Bolognese teachers to be recalled were those of Berengario da Carpi who wrote a famous commentary on the treatise of Mondino of Guglielmo da Saliceto who might be called the father of the surgical renaissance and later on in the sixteenth century those of Giulio Cesare Aranzi of Costanzo Varolio and of Gaspare Tagliacozzi who originated the method of plastic reconstruction of the nose by means of skin flap which had since been known as the Italian method Andrea Vesalio before going to Padua where he taught anatomy for seven years occupied the chair in Bologna In the eighteenth century there were the famous names of Anton Maria Valsalva Morgagni's master and of Luigi Galvani the immortal discoverer of animal electricity

It was not known where during the early centuries the school of medicine and law had their seats The scholars of the different nations had special places of meeting as also their own chapels in the churches The English scholars had very early a chapel in the Church of S Salvatore it was erected to the memory of S Thomas a Becket archbishop of Canterbury who had been a scholar in the Studio of Bologna. The old chapel was destroyed about the middle of the sixteenth century but two things belonging to it were preserved—an old altarpiece by Vitale da Bologna showing the Virgin with John the Baptist S Thomas a Becket and an English scholar and the famous pivial of Pope Innocent IV now in the Civic Museum representing the martyrdom of Thomas a Becket in silk and gold As in those times it was difficult to procure the rooms and books necessary for studying so it was almost impossible for the students of medicine to procure bodies for anatomical study Not infrequently students or masters snatched corpses by night from the cemeteries carrying them by stealth to their own house But by degrees the condition of the Studio became better and the anatomical theatre was finished in 1720

The anatomy lecture generally consisted of three parts the theoretical lecture the discussion the inspection of the cadaver The professor at first sat in his chair reading the textbook of Avicenna or Galen or of Mondino and with a long stick pointed out to the assistant (better known as the sector) where to cut the cadaver By degrees the lessons in anatomy acquired so much importance that they were frequented not only by the students of medicine but by large numbers of persons curious to know something of the structure of the human body The archives of the State contained a very important collection of miniatures in which are represented some of the most important lectures or anatomy given in the hall one of which has remained famous in history for having been given by a woman Laura Bassi a great philosopher and anatomist

To-day Professor Putti concluded this old anatomical theatre in which we are now assembled proposes in its past glory The lectures are now given in a big anatomical theatre which forms part of the modern and rich Institute of Anatomy Here remain flattering the spirits of the great masters who once made the name of Bologna glorious in the world

The visitors then inspected the magnificent library consisting of a vast collection of books in all languages housed in a series of splendidly proportioned rooms with which only such great libraries as the Kings in the British Museum are to be compared The cathedral was then visited after which such members as were energetic enough to disregard the heat paid visits to other objects of interest In the evening all were the guests of Professor Putti at dinner in the Hotel Stella d'Italia

THE MOUNTAIN HELIOTHERAPEUTIC INSTITUTE

On the following morning (September 24th) the party left at 6 o'clock by train to Mestre en route for Cortina d'Ampezzo in the Dolomite region, to visit the heliotherapeutic Instituto Codivilla for surgical tuberculosis, which is called after Professor Putti's predecessor in the directorate of the Institute Pizzoli At Mestre motor cars were in waiting to complete the journey by road Passing through picturesque old towns such as Treviso, with its watercourses and Vittorio-Veneto the scene of the final capitulation of the Austrians, into the hill country, the occasional ruins of buildings showed that the war zone had been entered The latter part of the journey lay among mountain scenery until Cortina d'Ampezzo was reached lying at the foot of the great Tofano peaks Here the relics of warfare consisted of huts and tunnels high up among the peaks This was the scene of that extraordinary mountain warfare on and around the summit of which graphic accounts appeared at the time in the English newspapers For two years this district was occupied by large Italian forces and cable transport was largely used to supply the guns and troops with ammunition and food Professor Putti described the great difficulties experienced and the heavy mortality which occurred owing to such accidents as lightning and avalanches The bare rocks of the Dolomite range are very susceptible to the destructive effects of the weather and fall of rock and stones are frequent

The Codivilla Institute was visited on Thursday morning The building in which the hospital is lodged was an Austrian hotel before the war but it is well adapted to its present use It is situated little over a mile north of Cortina in a favourable situation looking due south and with high mountains to the north those on the east and west not being near enough to prevent the sun's rays from reaching the front of the building for the whole of the winter and the greater part of the summer days It contains 100 beds 50 of which have been occupied since January last The rainfall is heavy as is usual in such high altitudes (or nearly 5 000 feet) but rainy days are comparatively few when the barometer occur the mercury vapour

quartz lamp is used The methods followed are much the same as those in Leysin Careful meteorological observations are made and recorded, and it is hoped in time to find scientific explanations for some parts of treatment which are at present only empirical One problem which Professor Putti referred to as needing solution is the question why some cases of tuberculosis do better at the seaside than in high altitudes and some worse Much patient investigation will be needed to explain this puzzling fact

In the winter, bedridden cases are exposed to sunshine in the open air as long as the temperature does not fall below 46° F, but ambulant cases are allowed to run about naked in the snow and in the sunshine down to a temperature of 14° F, or 18 degrees of frost

The results have been good, but as cases should preferably be kept here for two or three years, it is obvious that only a very few of the tuberculous children of Northern Italy can be treated at present

In the afternoon an excursion was made through a most picturesque part of the region to Misurina and its small lake, by a circuitous north-about route The return was to have been made by the more direct pass of the Tre Croci, but a bridge on this road having disappeared in the night the outward journey had perforce to be retraced, except by those active persons who chose to walk some nine miles, and were well repaid for their exertions

On September 26th, the last day of the tour, the association bade farewell to Professor Putti with many expressions of gratitude and regard, and started in motors on the great Dolomite road by the passes of Falzarego, Pordoi, and Costalunga to Bolzano (Bozen) Those who had not travelled this way before could not fail to be struck by the wild grandeur of the scenery, the design and execution of the extraordinary zigzag road, and the skill and coolness of the drivers of the huge charabancs which run regularly along it At the summit of the passes, such as Pordoi, over 7,000 feet above the sea, the air was felt to be very chilly, in marked contrast to the heat of Bologna three days earlier

Some stupendous relics of the war were seen, such as a three-storied barrack just below the summit of a ridge over 10,000 feet high, and various other fortress-like buildings The remains of two front-line trenches, which formerly crossed the road, were still very obvious During the final run down into Bolzano, through beautiful wooded ravines and glens and among waterfalls and sawmills, the weather broke and heavy rain fell With this exception the climate had been extremely kind to the tourists

Opening of the Medical Schools.

KING'S COLLEGE HOSPITAL

ADDRESS BY SIR DAVID FERRIER

ON

FIFTY YEARS OF MEDICINE

It is now fifty years this day since I last had the honour of giving the introductory address at the opening of the session of the King's College Medical School All my colleagues on the Board at that time have passed away, and there are but few here to-day who were present on that occasion It is not improbable, however, that I may have among my audience the sons or daughters of some of those who were then commencing their medical studies

Half a century is a long period in one's professional life to look back upon, yet I often find it difficult to realize that so many years have elapsed It is one of the proclivities—or perhaps infirmities—of age to like to revert to the past, and if I may indulge in this respect for a few minutes, it is not as a *laudator temporis acti*, but in order to draw some lessons which may have a useful bearing on the present and the future

I need scarcely say that within the last fifty years there have been many remarkable changes in the world in general, and in the world of medicine in particular At the time of which I am speaking—namely, 1874—Listerism was only in its infancy, and but slowly making way against great inertia, as well as much active opposition For although in 1867 Lister had been successfully applying to surgery Pasteur's doctrines as to the germ theory of fermentation, his views had not yet been generally accepted, or extensively put in practice Surgical operations were relatively limited in range, and followed by frightful mortality, surgical wards often reeked of suppuration and sepsis, and many surgeons were still operating with instruments, and in garments, swarming with putrefactive germs

As late as 1880—three years after the advent of Lister to this hospital—when my late colleague, Professor Gerald Yeo, and I, at a meeting of the British Medical Association, showed that, with antiseptic precautions, the most formidable operations could be made on the brain without risk of the otherwise fatal meningo-encephalitis, there were not wanting eminent surgeons and others who shook their heads incredulously, or expressed their entire disbelief in the germ theory of sepsis

It is difficult for those of you of the present generation to realize the state of affairs not only in surgery, but in other departments of medicine fifty years ago Bacteriology was then practically non-existent We knew nothing of the germs, or methods of culture, of tubercle, cholera, anthrax, malaria, diphtheria, tetanus, syphilis, and a host of others

With the exception of the Jennerian vaccine—the prototype of all others—we had no other vaccines, and no prophylactic or curative serums, such as those which have practically robbed hydrophobia, diphtheria, and tetanus of their terrors Internal secretions and vitamins, with their marvellous influence on development, growth, and nutrition, were mysteries entirely unrevealed Biochemical tests, such as those of Widal and Wassermann, had not been dreamt of Instruments of precision were few and simple Except the stethoscope, ophthalmoscope, laryngoscope, and clinical thermometer—the last only then coming into general use—there were practically no other aids to clinical investigation There were no x rays to enable us to illuminate and explore the innermost recesses of the body, and no electro-cardiographs to register every phase of the heart's action

All these methods, and the transformation of medicine which has been the result of their application, have been invented, or discovered, within the last fifty years—many of them within the recollection of the youngest of you

Our remedies were for the most part purely empirical The science of pharmacology was only in its infancy, and we could give little or no reason for our prescriptions beyond the fact that they had been found useful by our predecessors I could go on adding to the catalogue of things which we did *not* know half a century ago—things which form the very basis of modern medicine—until I fancy I might hear some of you exclaim, "Then what *did* you know?"

Yet it should never be forgotten that, so far as pure observation could carry them, unaided by other than the most simple instruments of precision, the physicians of old have never been surpassed in their delineation of the symptoms and natural history of disease, and skill in prognosis The names of Sydenham, Heberden, Bright, Matthew Baillie, and many others among our own countrymen, will compare favourably with any of those of the present day If their theories as to etiology and pathology were often founded on what we can now smile at as crude assumptions, we need not pride ourselves unduly on our superior knowledge

Considering the transformation or revolution, that is taking place at the present day in our conceptions of life, matter, and energy, it is not unlikely that someone of my audience, reviewing the progress of medicine fifty years hence may have to comment in a similar manner on the primitive character of our present day notions on many problems of health and disease. Still when all is said, I think, as regards scientific medicine we may take the motto of Tydeus, reasonably boast that we are much superior to our fathers."

Now what has been the principal cause of this superiority? Unquestionably, in my opinion, it has been obedience to the illustrious Harvey's injunction to the College of Physicians to search out the secrets of Nature by way of experiment." It is by the application of the experimental method to the elucidation of vital problems that within the last half-century medicine has been so transformed that its progress has with truth been characterized as a veritable romance. As the late Lord Fletcher Moulton, in his evidence before the Royal Commission on Vivisection, has said:

> No man who knows anything of science has any doubt whatever that the right way to advance knowledge is by experiment. When we are reduced to observation science crawls. When and in proportion as you can use experiment the science advances rapidly. The more complex the subject is the more factors there are at work the more essential the experimental method is and the most complex of all phenomena are those that relate to human being. (Royal Commission on Vivisection.)

Since the experimental demonstration of the circulation by Harvey three hundred years ago almost everything that we know with any degree of certainty with respect to the functions of the body—the brain and nervous system, respiration, digestion, assimilation and nutrition, internal secretion, the action of drugs, morbific agents, and the like—has been gained by experiments on animals, the accidental experiments or injuries on man, or the intentional experiments of inquirers on themselves.

By the discovery of the germs, and their modes of transmission, of malaria, yellow fever and sleeping sickness, regions of the earth formerly uninhabitable have been made accessible to civilization and human enterprise. It has been abundantly demonstrated that animals as well as man can be protected against such diseases as anthrax, tetanus, and glanders, and many other infectious diseases can be prevented, and might be altogether suppressed if intelligent co-operation could be made to take the place of the dense ignorance and stupid, not to say criminally fostered, prejudices, which so commonly prevail among mankind.

As to those diseases which, so far as we know, do not owe their origin to infectious germs, what can be considered *more marvellous than the powers recently conferred* on medicine by physiological experiment on the ductless glands and their secretions? As the late Sir William Osler has picturesquely expressed it:

> No such miracles have ever been wrought by physicians as those which we see in connexion with the internal secretion of the thyroid gland. The myth of bringing the dead to life has been associated with the names of many great healers, since the incident of Empedocles and Pantheia, but nowadays the dead in mind and deformed in body may be restored by the magic wand of science. The study of the interaction of the internal secretions, their influence on development upon mental powers, and upon disorders of metabolism is likely to prove in the future of as benefit not less remarkable than that which we have traced in the infectious diseases. (*The Evolution of Modern Medicine.*)

Osler's prediction has been amply verified within the few short years since his lamented death by that most recent triumph of experimental medicine—the discovery of insulin—the "elixir vitae" to thousands of sufferers living precarious lives with fatal coma like the sword of Damocles threatening to descend on them at any moment. How this appears to unprofessional eyes may thus be described in the words of Lord Knutsford in the recent debate in the House of Lords on the Dogs' Protection Bill:

> You see a patient come into hospital with large eyes, sunken face, and stooping figure. He is given insulin. It is not a conjuring trick. It is a miracle. In quite a short time the man is bright and happy and smiling again, and his disease is forgotten.

But while we can boast of triumphs such as these, we cannot afford to rest and be thankful. The problems that demand solution are many and urgent. Though we know a good deal as to the characters, mode of growth, and dissemination of many of the infective germs, we as yet know little or nothing of others—the so-called filter-passing germs—and still less any satisfactory method of combating their ravages. Our knowledge of cause unfortunately outruns our ability to prevent or cure. The tubercle bacillus was discovered over forty years ago, and yet, in spite of all our efforts, it slays its thousands every year, and this same has to be said of other diseases of men and animals which cause incalculable loss of health, wealth, and life. The state of affairs is still worse in regard to diseases of which we know neither the cause nor the cure, such as disseminated sclerosis, progressive muscular atrophy, paralysis agitans, and the like.

Most prominent of all in the eyes of the world at the present moment is the problem of cancer, which unhappily seems to increase as civilization advances. The urgent need for more light, and the triumph already achieved by scientific research in regard to the infective diseases, has led to a world-wide campaign against malignant disease in the hope that combined effort will succeed where individual effort has hitherto failed. Our hopes were recently raised high that here again Toronto had achieved another magnificent triumph, only, however, to be shattered by further examination. We need not however despair, only we must guard against being over-sanguine as to the results of investigations of a purely *ad hoc* character. These will no doubt narrow the approach and pave the way to the ultimate solution, but it is quite possible that the key to the mystery will after all be given by some research undertaken for its own sake, or without any obvious bearing on the problem in hand.

Many such instances might be quoted. It would, for example, seem a far cry from a jelly-fish to a human being, yet as Lewis has recently shown Romanes's experiments on the bell of the Medusa have furnished the explanation of that most dangerous state of the human heart—auricular fibrillation—and the rationale of its treatment. The history of science affords abundant illustration of the fact that the most important and far-reaching consequences may flow from apparently insignificant beginnings. There is not a single addition to natural knowledge, physical, chemical, or biological, which does not find its appropriate place in the grand edifice of science and the powers it confers on mankind. The conquest of ignorance is our only sure defence against the diseases and other evils with which we are constantly threatened and assailed.

Yet, though pure science receives much lip-homage it receives but little general support and medico-biological research, in particular not only little support but much ignorant opposition, unless it gives immediate protection against disease, or promises absolution from the consequences of sins against the laws of health and indulgence for future transgressions. One is constantly met with the question, "What is the *practical* object of your proposed research?" If you cannot make this sufficiently plain to the unenlightened you are apt to be regarded as a visionary out of touch with the realities and needs of the world. This attitude is unfortunately not confined to the laity, but is all too frequently found even in our own profession.

While there is no branch of science which does not bear directly or indirectly upon practical medicine, that which above all others most intimately concerns you in your study of disease is physiology—appropriately termed the Institute of Medicine. It is only by an intimate knowledge of the functions of the various tissues and organs of the body and their interrelations practically applied in the clinical ward and pathological theatre that you can appreciate the true nature of disease and the meaning of its symptoms. And it is this alone that can furnish a sound basis for independent judgement, and secure freedom from any slavish adhesion to any system or blind obedience to the word of any master.

The practical application of the results of scientific research in all its forms—physical, chemical, or biological—towards the prevention and cure of disease is the duty of our profession. You will see therefore how your responsibilities are great, and that in the relatively short period of the medical curriculum you will have no time to waste if you

are to acquire the requisite knowledge to qualify you for your work Though it is impossible at the present day to be an expert in every branch of science, general practitioners and specialists alike, besides learning the essentials of medical and surgical practice, must gain such acquaintance with the principles and methods of special scientific research as to know how and when they may be made available for the benefit of those entrusted to their care

Most of you will no doubt engage in general practice at home or abroad, and thus form what has been rightly termed the backbone of the medical profession Others —probably many of you—will become specialists in one or other of the various departments into which medicine in the natural course of evolution has become necessarily divided And I need scarcely say that nowhere better than in this highly equipped hospital and school can you be fitted for any specialty that you may choose Some of you—I hope not a few—will become so enamoured of one or other of the strictly scientific bases of medicine that you will devote yourselves to research, like so many who have attained eminence in science proper, but who began their career as medical students

It would, I think, be a great misfortune if the increased facilities with which scientific methods have provided us for the diagnosis of disease, such as the *x* rays, electrocardiograph, biochemical, and other tests, should lead to atrophy of the *tactus eruditus*, and other trained faculties of the skilled practitioners of old, or to neglect of the simple or unaided methods of diagnosis, such as percussion, auscultation, and the like It would not be well if a surgeon were unable to diagnose the existence of a fracture or dislocation without the aid of a radiogram, or for a physician to be dependent on similar aid for the recognition of a consolidation of the lung, or the existence of a tumour in the brain Some indications, however, have been noted by our examiners of a tendency on the part of the younger generation to neglect the simpler methods, and to rely too exclusively on aids which may not be available at the critical moment Delicate physical and chemical apparatus are necessary in the clinical laboratory, but the results must be incorporated with those of other methods, and capable of application by the practitioner in the ordinary course of his work The various methods should supplement but not supplant each other, and as we see clearly only what we are prepared to see, clinical vision should be sharpened rather than dulled by the light of science

Scientific pharmacology does not necessitate the abandonment of purely empirical methods which long experience has proved to be of value in the relief of suffering The theories on which they have been based may appear to us fanciful, and we may not be able to give a rational explanation of their *modus operandi*, but it would be foolish to discard them There are many remedies, now out of fashion, which are still relied on, and apparently on good grounds, by physicians of ripe experience and sound judgement Nor should the study of the scientific bases of medicine ever be divorced from the most thorough-going study at the bedside The human body is a much more complex organism than that of the lower animals, and infinitely more so than any mere physical or chemical compound The agents employed in the treatment of disease do not necessarily act *in vivo* only as they do in the test tube The living body is, as has been said (Dale), in many ways an essential partner in its own cure And, more particularly, the psychical side of man—the impulses and emotions by which he is swayed—constitutes a factor which highly complicates the action of all the remedies of the *Pharmacopoeia*

Ideas and emotions are not mere subjective states of the organ of mind, but at the same time corporeal influences which thrill to the tips of our fingers, and manifest themselves not only in outward expression, but also in modification of the activity of all the vital functions Though much valuable work has been and is being done in this direction (Lange, Pavlov, Cannon, etc), we as yet know comparatively little as to the mode of origin, and channels of transmission, of those corporeal influences but it is certain that the pleasurable emotions, such as faith and hope, *exalt*, while the depressing emotions, such as fear, doubt, and anxiety, *depress* all the vital functions How to promote the one and combat the other is often more a mark of therapeutic skill than a judicious selection from the *Pharmacopoeia* This has long been implicitly recognized and acted on in daily life Prescriptions, apart from any intrinsic value they may possess, are also largely vehicles of suggestion Everyone knows that a prescription by the eminent physician, Sir A B of Harley Street, may have a very different therapeutic value from exactly the same prescription given by Mr C D of Little Pedlington And there is a grain of truth in the remark by Petronius Arbiter, the cynical courtier to the Emperor Nero, that a physician is "only a satisfaction to the mind"

The influence of suggestion, familiar to physicians from time immemorial, has in recent times been raised to the dignity of a cult or religion, under different names, and following different methods, rites, or ceremonials, and remarkable successes have been claimed by their respective votaries I have no intention of critically examining the respective merits or demerits of these various methods, but would merely remark that suggestion, however induced, should be kept in its proper place No amount or kind of suggestion will, for instance, reduce a dislocation or remove a tumour from the brain Apart, however, from special methods of suggestion, however commendable some may be in certain circumstances, it must ever be the endeavour of the physician to mobilize all the defences of the organism, psychical as well as physical, against the attacks of disease, and for the restoration of health

It is related of a famous painter, when asked how he mixed his colours in order to produce such brilliant effects, that he replied, "I mix my colours with my brain" Medical practitioners, to be successful, must do likewise with their prescriptions How to do so is an art—the true *ars medendi*—and, like all arts essentially individualistic, difficult to define, difficult to analyse, and difficult to communicate But there is one factor within reach of you all—surpassing all others in importance—and that is *a thorough knowledge of your work* This by itself can outweigh a multitude of defects, and will constitute the best, and most solid, basis of that self-confidence and decision which are so necessary to inspire faith and trust on the part of those with whom you have to deal This knowledge you can all certainly acquire here if you duly avail yourselves of the splendid opportunities provided for you in this great hospital and medical school

CHARING CROSS HOSPITAL

SIR HUMPHRY ROLLESTON'S ADDRESS ON REASONS FOR ENTERING THE MEDICAL PROFESSION

THE introductory address to the students of Charing Cross Hospital was given on October 1st by Sir Humphry Rolleston, Bt, K C B, M D, President of the Royal College of Physicians of London

After a few words of congratulation to the prize winners and of encouragement to those who on this occasion had not gained the palm Sir Humphry Rolleston remarked on the advantage in competing for prizes quite apart from the place obtained in the list

It is (Sir Humphry said) a preliminary canter, and part of the training for the compulsory examinations that await the student at another place, it provides practice in clear expression and marshalling of knowledge in the written paper, and accustoms the candidate to the trial of a viva voce examination when a question on an almost unexpected subject suddenly impinges on an anxious strained brain and demands an accurate answer

Discussing next the reasons for entering the medical profession, he said

Although we have all committed ourselves to the profession of medicine it is not a mere act of curiosity to mention the reasons that may lead up to such a decision

for although the Rubicon is passed there are many provinces of medicine open from which to choose the particular line of work likely to be most congenial The reasons attracting men and women to our profession may decide in advance what form of practice or activity they will ultimately adopt, and to these brief reference will be made, but usually the advice not to specialize early has been unconsciously followed

While one, and certainly the commonest reason for entering a profession is, of course, to gain the wherewithal to live this can be much more easily and successfully attained by going in for business or trade, strictly so called, than for medicine, which has been described as a noble profession but a decidedly bad trade Still undoubtedly many choose medicine with this aim in view, for, at any rate in the past, more members of the healing art gained a living of a sort than is the case among the followers of the Law or the Church it is true that the prizes are few and the income often small—sometimes, indeed, barely a living wage, or, as it has been called, a "starveling" before the war it was, I believe, estimated that the average income of the members of the profession as a whole was about £300 a year—though it must have been difficult to arrive at any sum and then approximately only Now, with the rise in the cost of living it must be much higher, possibly £500 to £600 a year But just at the present moment there is considerable reason to believe that the medical profession is overstocked by those recently qualified, last year the number of new practitioners registered was 2 482, the highest on record and the number of medical men is increasing more rapidly than the population so that the rate is approaching one medical man to 1 000 of the population As the result of the rush into the profession after the war, the universities and examining boards are now at the crest of the wave as regards candidates for the final examination—for example at the final Conjoint Board examination in July last there were more than 500 candidates up it is true that they did not all get through but that the recently qualified are finding it hard to obtain resident posts there is I fear no doubt At the Victoria Hospital for Children Chelsea, there were for the two posts of house physician and house surgeon vacant last July, 83 applicants of whom 23 or 27 7 per cent were men, and 60 or 72 3 per cent women and I have heard of sixty candidates for one house appointment elsewhere

This temporary condition must of necessity right itself in accordance with the laws of demand and supply and, indeed this corrective process may have begun already Last year the entry into the medical profession dropped from 2 000 in the two previous years and 3 500 in 1919, to 545 which is little more than a third of that (1 500) in the first year of the century It is interesting to note that in the United States of America there was no evidence of a fall in the 1923 entries the total—17 808—being nearly 900 more than in 1922 In spite of the limitation of students and the higher entrance requirements enforced at the most efficient medical schools in the United States, the total entries since 1919 have increased at the rate of approximately 1 000 students each year[1] The contrast between the 1923 entries in the United States on the one hand and Great Britain on the other hand calls for some explanation Between 1904 and 1919 probably as a result of Abraham Flexner's drastic report on the medical schools in North America (1910) the number of schools fell from 160 to 85 and the number of students from 28 142 to 13 052 so that this event renders the conditions different from those in this country further poor students are encouraged and financed by scholarships and loan funds much more than in England and the American colleges expend from 500 to 1 000 dollars annually on each student in excess of their fees[2]

Possibly the phenomenal fall in the British entries in 1923 may have been due to more than one cause but apparently the most important factor is that under the new Regulations of the General Medical Council the student must now postpone registration until, in addition to his examination in general education, he has passed a recognized examination in elementary chemistry and physics, this year's figures will show more truly the state of the entry into the profession Further economic conditions—namely, the higher cost of medical education and the accompanying fall in fixed incomes, though neither of these were special to 1923—may by accumulated effect have begun to exert an influence deterrent to entrance into a profession which is not pre-eminent as a method of getting rich quick There is also a very considerable fall in the entry of women into the profession whatever the cause there is no question that 1923 saw a very distinct drop which contrasts with the war and post-war rise in the number of female medical students The evidence of overcrowding among the qualified women and realization of the difficulty of obtaining posts when a degree or diploma has been obtained may have warned parents not to encourage their offspring especially their daughters to enter our profession

A not uncommon reason for entering our profession is the accident so to speak of environment or heredity When the father is a medical man the home atmosphere often prepares the son to follow in the paternal footstep as a normal course of evolution, especially as there may be a practice waiting for him, so without any special ambition or inclination for another walk of life he regards it as a natural family succession I know of a family with seven generations in succession This is perhaps a survival or an unconscious imitation of ancient custom, for in very remote times the art of healing was hereditary from generation to generation in the sacerdotal caste In Ireland until a comparatively recent period the profession of physic passed from father to son just as did the practice of other arts and crafts and was the relic of the time when a medical practitioner was attached to the clan or house of a chieftain (Kirkpatrick) On the other hand, a boy or girl may early decide on the physic line and keep to this resolution the impulse may date from some accidental experience such as injury or illness and the resulting contact with the striking personality of a medical attendant Sir William Bowman is said to have been led to take this step by his interest in the treatment of a wound in his hand sustained when experimenting with gunpowder Sydenham was attracted to the profession he so greatly adorned by the influence of Dr Thomas Coxe who was attending his brother Colonel William Sydenham, in 1646 An allied but apparently curiously infrequent reason is the desire to be in a position to look after one's own disabilities Elisha Kent Kane (1820-1857) surgeon in the United States Navy who went on the two American expeditions (1850-51 1853-55) financed by Henry Grinnell in search of Sir John Franklin originally intended to be a civil engineer but after an attack of rheumatic endocarditis he was advised by his friends to take up medicine on the ground that he would be happier if he understood and so could manage his own case Interest may suddenly be awakened by the accident of reading a medical book or article as in the case of Dr Tertius Lydgate in George Eliot's *Middlemarch* a portrait known to have been drawn in part at least from life Among those who like William Hunter the elder brother of the more famous John have started life with the intention of entering the Church but have abandoned it to practise for the cure of our ills bodies was Sir William Osler who is believed to have been partly influenced in this step by reading Sir Thomas Browne's *Religio Medici*

A few men paradoxical as it may at first sight appear, take a medical degree without any intention of ever practising this is not as sometimes happens in the case of the Bar from a belief that it is a liberal education to belong to a learned profession but because they have already decided on devoting their lives to investigation of teaching in one of the sciences such as physiology biochemistry or morphology or pathology which are so closely bound up with medicine Such men rightly recognize that their outlook is greatly broadened by

[1] Colwell N P *Journal of the American Medical Association* Chicago 1924 lxxxii 839

passing through the whole of the medical curriculum, that as research workers they are better placed to understand the bearing of problems to be solved, and that as teachers of medical students they are thus in a much more advantageous position to deal sympathetically and for the best with future practitioners In short, the experience gained by passing through the medical curriculum tends to alter the outlook of the teacher of the preliminary biological sciences Let us contrast the extremes of the groups of teachers—those who know their science only with those who in addition have been through the curriculum—and think for a moment of the difference in the attitude that may be adopted by the two categories of teachers, no doubt much could be said for both, a teacher of the first group may say in his enthusiasm that his function is to teach and examine on the science, whereas one of the other class will consider that his business is to ground future medical men in what he conceives to be necessary to ensure their efficiency

In the days that were earlier, men sometimes entered the medical profession because of their ambition to be in one of the fighting forces, for when prevented by mental or bodily defect from gaining admission to the executive branch, they fell back on the Royal Naval Medical Service, the Royal Army Medical Corps, or the Colonial Service Love of travel and of adventure, which can be gratified in the services, is another possible incentive, and there is in addition the material attraction of a pension to fall back on But the shortage of entries into the services at the present time shows that these factors are no longer operative Similarly, the number of medical men who now enter the mission field is so small that a desire to be a medical missionary accounts for very few entries into our profession But how many take up medical work from feelings of real devotion to their fellows, and quietly carry through this high ideal in the ordinary rough-and-tumble of life, it is impossible to guess

A somewhat unusual reason—at least, there are few such confessions—for adopting the medical, though it is far from unknown in the nursing, profession is disappointment in love James Macartney, the distinguished professor of anatomy and surgery at Trinity College, Dublin (1813-37), when refused by Miss Mary Ekenhead, "determined to adopt the profession of Surgeon in order to harden his heart", but the course of his love affairs soon turned into smooth waters, and after marrying Miss Mary he became a demonstrator of anatomy to Abernethy

The factors responsible for taking up medicine may determine the line of practice—general, consultant, specialist, or in the several services of the State—that is eventually adopted Heredity, in the form of a family practice, is an obvious example of a reason for becoming a general practitioner early marriage and the need of money, or love of country life, may have the same effect A bent for research and seeking out "the secrets of nature by way of experiment" of course provides whole-time pathologists, physiologists, and biochemists Ambition, backed by a certain degree of ability and patience of no small degree, is responsible for most of those who attempt consulting practice, but even when the decision has been made so far, the choice of medicine, surgery, or obstetrics and gynaecology may be determined by opportunity or accident—that is, the contemporary prospects in these departments of practice at the medical school to which the individual is attached Thus, at one hospital two who had started as general physicians and another who was well known as a pathologist eventually became gynaecologists, and careful calculation as to probable vacancies has been known to settle the choice between medicine and surgery Interest and technical skill are the natural reasons for adopting one of the special branches, such as ophthalmology, laryngology, otology, orthopaedics, urology, anaesthetics, or dermatology, and there is the mundane advantage that the wait during what has been called the mere bread stage, before butter, much less jam, can be afforded from the rewards, is not so prolonged as in the case of the general consulting physician

Scotland.

St Mungo Chair of Surgery in Glasgow

The curators of the St Mungo Chair of Surgery at the University of Glasgow have appointed as St Mungo Professor Mr Peter Paterson, M B, C M, F R F P S G, in succession to the late Dr Robert Kennedy This chair was established in 1911 in place of the former chair of clinical surgery, and is carried out in association with the Glasgow Royal Infirmary Mr Paterson received his medical education at Glasgow University, where he graduated M B, C M in 1891 He later pursued his studies in London, where he obtained the M R C S After a period of work in various Continental centres, where he devoted his attention to surgery and kindred subjects, he became assistant to the Regius Professor of Surgery in Glasgow University, Sir William Macewen He was also appointed to the staff of the Royal Infirmary, where in 1906 he became visiting surgeon For some years he held the post of professor of surgery in St Mungo's College, Glasgow He has gained distinction for research work, having held the Foulis Memorial Scholarship for eminence in pathology, and he was awarded a Weber-Parkes medal for a memoir on immunity in connexion with tuberculous infection He has contributed many papers on surgical subjects to various journals, and has for many years been recognized as one of the leading operating surgeons and teachers of surgery in Glasgow

Edinburgh School of Medicine Calendar

The annual calendar of the School of Medicine of the Royal Colleges at Edinburgh has just been issued for the session 1924-25 This school of medicine is of considerably greater antiquity than that connected with the University, its lectures being traceable back to the year 1505, when the Surgeon-Barbers obtained their charter The annual average of students who attend classes in this school numbers 900 Of these the greater number are students proceeding to the University degree in Edinburgh, but a considerable number are engaged in studying for one or other of the conjoint qualifications of the Royal Colleges Students intending to graduate at one of the Scottish universities may, by the Ordinances of the University Commissioners, attend at this school one half of the classes required for graduation in medicine, and many of the students at Edinburgh University avail themselves of this privilege The present number of the lecturers is forty two, of whom most deliver courses qualifying for graduation, while some give lectures upon special subjects of medical science The dean of the school is Dr John Orr

Opening of the Sanderson Hospital, Galashiels

The new hospital for infectious diseases, which has been presented to Galashiels by the trustees of the late Mr Robert Sanderson, a pioneer in the local tweed industry, who died in 1915, was formally opened on September 22nd The hospital is situated on the edge of the town, the grounds occupying an area of three and a half acres The hospital buildings include an administration block of two stories with a basement, a detached pavilion of scarlet fever wards, another pavilion for observation wards, and a third comprising outhouses, laundry, mortuary, heating chamber, and motor house In the scarlet fever block there are four beds in the men's ward, six in the female ward, and two private wards, each containing one bed In the observation block there are four wards with two beds in each In the event of an epidemic extra bed accommodation can be arranged With the approval of the trustees cases of infectious diseases from the county and burgh of Selkirk will be accommodated in the hospital, and included in the hospital equipment is a motor ambulance In addition to the title deeds for the hospital the trustees have arranged a feu charter providing for a public right of access between the Selkirk and Tweed roads Certificates are also included providing for the recovery of the feu duties in perpetuity for the ground on which the hospital buildings have been erected

The Right Hon William Adamson, M P, Secretary for Scotland, who was present at the opening ceremony, drew attention to the new departure, in that a family doctor was thus entrusted with a town had voluntarily come forward to make a most generous provision for a service which the town council had the power, and, indeed the duty, of providing at the cost of the ratepayer He hoped that this precedent—namely, that people of influence should deliberately make a provision to benefit the whole of the ratepayers of the area in which they were interested—would be followed elsewhere not only making it possible for the ratepayers to have modern hospital facilities, but also relieving them of a large part of the cost of such provision Such an undertaking was a move in the right direction, since the development of modern medicine rendered it easier to maintain an efficient service in a fairly large unit than in a number of small hospitals

Conference of Scottish Insurance Committees

The twelfth annual conference of the Scottish Association of Insurance Committees, held in the Town Hall, St Andrews, was attended by about 200 delegates, under the chairmanship of Mr George Cumming (Forfar), president of the association In his presidential address the Chairman stated that they might well be content that the question of the remuneration of panel doctors was now settled for some time to come He deprecated the fact that the friendly societies had no representative on the Royal Commission appointed to inquire into the working of the National Health Insurance Act A resolution was later submitted to the meeting and carried unanimously, that medical service should include at least nursing, specialist and consultant services A further motion, to the effect that dental and optical benefits should also be provided for the insured, was carried by a large majority A considerable amount of discussion took place in regard to a scheme which had been drawn up by the clerk to the Ayr County Insurance Committee for the co-ordination of medical services It was proposed by this scheme that a new authority should be constituted in each burgh and county, which would be elected in the same way as the education authority, and would receive and administer all Government grants and other sums paid under the Insurance Act for medical benefit A vote of thanks was passed to the originator of the scheme which, however, was *not adopted*

Glasgow Western Infirmary

The managers have appointed Mr J Mill Renton, M B Ch B, F R C S Edin a visiting surgeon to the Glasgow Western Infirmary The vacancy was caused by the promotion of Mr Archibald Young to the Regius Chair of Surgery

England and Wales.

The Manchester Medical Society

The Manchester Medical Society has published a syllabus of the meetings to be held during the session 1924-25 At the first meeting, on October 8th, at 8 p m, Dr A I Hurst will give an address on the sphincters of the alimentary canal and their clinical importance On November 5th a discussion on jaundice has been arranged and on December 3rd a discussion on chronic backache in women The January meetings will consider the radiography of the heart, the surgery of the astragalus and the use and abuse of digitalis On February 4th the president, Professor G R Murray, will speak on things in health and disease Further information may be obtained from the honorary secretary, Dr A Hillyard Hehir 26, St John Street, Manchester

Post Graduate Courses

The South West London Post-Graduate Association has arranged a series of lectures demonstrations at St James's Hospital, Balham, from October to December The first two lectures will be given by Sir James Barr on October 16th and 17th, and will deal with the work of Albert Abrams's methods of diagnosis and treatment Other subjects treated during the course include the use and artificial light treatment by Sir Henry Gauvain, the diagnosis of tumours, by Mr Pearce Gould, medical examination for life insurance, by Dr F G Chandler, and the prevention of early recognition of trouble during childbearing, by Dr J S Fairbairn A full syllabus of the course may be obtained from Dr P J Saunders *10 Lord Road Wandsworth Common* A course of two lectures will be given at the Hospital for Sick Children, Great Ormond Street, on Thursdays from October 9th to December 11th inclusive with the exception of October 23rd These lectures are free to medical practitioners and the subjects considered include daily work in connection with the interpretation of blood sugar curves and acute infections of the nervous system in children A course of ten lectures on elementary psychotherapy will be given at the Tavistock Clinic W C, by Dr H Crichton Miller, on Mondays, at 5 30 p m commencing on *October 13th* The first lecture deals with psycho-physical interaction and the second with persuasion and suggestion At St Mary's Hospital Medical School a special three-days post graduate course will be held on October 4th 5th and 6th The subjects include chronic arthritis and allied disorders the common cardiac irregularities diagnosis and diseases the surgical treatment of gastric ulcer and the medical treatment of colonic anæmia The hospitals comprising the clinical school of the University of Liverpool have arranged again to hold lecture demonstrations for practitioners during the university term, the programme being so planned that on each day a demonstration is given by only one hospital The demonstrations commence at 3 30 p m and are largely clinical in character The first one, at the Children's Hospital, on *October 6th*, will deal with hare-lip and cleft palate A short intensive course for post-graduates will be held at the City of London Hospital for Diseases of the Heart and Lungs from October 13th to 17th The subjects to be dealt with include diabetes and tuberculous pneumothorax, electrocardiograph mediastinal tumours, and the complement fixation test Fuller details of all these courses will be found in the Diary

Tuberculosis in Birmingham

The annual report for 1923 of the chief tuberculosis officer for Birmingham shows that there has been an increase during the year in the number of tuberculous patients who have been treated The increase is more marked relatively in the case of non pulmonary tuberculosis, largely in consequence of an increase in the provision or arrangements for treatment The death rate in the case of both pulmonary and non-pulmonary disease has been practically stationary during the last four years but whereas the figure for non-pulmonary disease has been appreciably below the corresponding figure for England and Wales the Birmingham death rate for pulmonary tuberculosis has been above the average Unsatisfactory conditions as regards employment and housing have militated against preventive work though considerable help has been available for deserving persons For the treatment or isolation of cases of pulmonary tuberculosis sanatorium or hospital accommodation is provided for 670 patients in addition to 140 beds for children suffering from non-pulmonary tuberculosis and a variable number of beds in hospitals amounting probably to ten or fifteen at any one time Fifteen trained nurses are employed, and over 50 000 domiciliary visits were paid during the year Notifications to sanatorium numbered 1 831 and there were 31 635 attendances at the municipal anti-tuberculosis centres of which 17 853 were for treatment alone 2 613 new examinations were made representing an increase on the previous year In connexion with the examination of sputum at the municipal anti-tuberculosis centre the Dawson concentration method was applied to 850 specimens which were previously examined by the usual method Of these after the concentration, 140 were shown to be positive and after the second concentration 5 more positive results being reported after subsequent concentration In connexion with the Yardley Wood Sanatorium the sedimentation method devised by Lilleman and Erlandsen was used From 1 016 specimens

shown to be positive by this examination after a negative result had been obtained by other methods, 625 positive results were obtained after the first concentration, 330 after the second, 35 after the third, and 26 after the fourth With reference to the question of the value of pasteurization of milk, it is pointed out that for some time past 85 per cent of the milk sold in Birmingham has been treated either by sterilization or by flash-point pasteurization, and the evidence obtained from the local infant welfare centres goes to show that such milk has not caused harm to young infants Pasteurization, it is claimed, has been of great value in preventing the spread of scarlet fever and other septic infections as well as tuberculosis

SOCIAL HYGIENE CONGRESS AT WEMBLEY

A report of the Social Hygiene Congress, held at the British Empire Exhibition, Wembley, last May, was published in our columns of May 17th (p 875) The National Council for Combating Venereal Diseases, which organized this congress, has now published the papers there delivered, and the volume contains a mass of information which would be of still greater value to those interested in social hygiene if a detailed index had been provided In his article Sir George Newman gives an account of the action now taken by the Ministry of Health in combating venereal disease, he describes the history of the public organization of the treatment of venereal diseases and the establishment of various schemes, bringing forward statistical evidence in support of his belief that there is a definite and progressive decline of these diseases in this country After a brief consideration of the three difficult questions of compulsory notification, compulsory treatment, and prophylaxis he summarizes the principles of prevention Education of the public as to the incidence and dangers of venereal diseases he considers is of prime importance Secondly, the sources of infection should be reduced by the provision of prompt and skilled advice, and adds "It is not practicable for Government or any high contracting party to usurp the position of the private medical man in his relation to his patient" Sir George Newman's third principle is the essential importance of avoiding the separation of treatment and prevention in other words, "every treatment clinic has direct preventive work to do" Sir Leslie Mackenzie has an article dealing with the administrative control of the venereal diseases in Scotland, with special reference to the formulation and administration of official regulations, he concludes that the primary commandment "Thou shalt not kill" has many corollaries, one of which is "Thou shalt not spread disease" Dame Rachel Crowdy gives an account of the international position with regard to prostitution and the suppression of the traffic in women and children She believes that there is a gradual and definite growth of an international conviction that the white slave traffic must be suppressed at all costs Some reports received in reply to an inquiry addressed to various nations which had a system of regulation of licensed houses are included in her contribution She considers that it has been established that the evidence of the effects of such systems are fairly easily obtainable, and that in a short time definite conclusions will be deducible The section devoted to imperial questions contains reports about the problem of social hygiene in the Dominions received from Canada, Australia, India, Natal, Kenya, Nigeria, and British Guiana One section is devoted to the discussion of the place that the general practitioner should occupy in the campaign against venereal diseases, and includes papers by Dr C E S Flemming, Dr Madeline Archibald, and Dr Alfred Cox, Medical Secretary of the British Medical Association The educational section contains two papers of outstanding interest from a practical point of view—one by Sir Frederick Mott on the psychology of adolescence, and the other by Professor J Arthur Thomson on education and social hygiene

The congress was organized as a step in the co-ordination of the social problems of the Empire The Minister of Health was the honorary president, and papers were contributed by representatives of Government departments at home and overseas, delegates from local authorities, and representatives of social welfare organizations and professional bodies

Correspondence.

THE SURGICAL TREATMENT OF ANGINA PECTORIS

SIR,—As you point out in a leading article of your last issue (p 583), several different forms of surgical intervention have been undertaken with a view to relieving the major symptoms of angina pectoris It is not my purpose, in writing this letter, to discuss the pathology of this grave and painful disorder, but I think it will be clear that we are as yet very far from understanding the manner in which anginal pain is produced or the precise nerve channels involved In these circumstances surgical interference remains in large part still empirical

My purpose is to point out that from case reports so far published it is often, I do not say always, impossible to be sure that the surgical destruction of this nerve path or that has had anything to do with the relief of pain experienced In other words, sufficient data for the empirical conclusion are often lacking If a patient suffering from angina pectoris is put to bed and is adequately nursed for a period of weeks or months, common experience tells us that often great relief will follow, and this relief may last for long periods of time after the patient resumes his daily occupations Rest of this kind is part and parcel of the treatment which a patient receives when he comes under the surgeon's hands, and its influence upon the subsequent history of the anginal pain is scarcely considered in most of the reports hitherto published of patients submitted to operation I do not say that rest is the reason why the pain has disappeared in the cases in which relief has been recorded, but if the influence of rest cannot be excluded *by statements contained in a given case report*—and that is often how the matter stands—then that case report becomes valueless as evidence that surgical interference has played its part successfully The point is simple and obvious enough, and it might be thought that the exclusion of the effects of rest might be taken for granted Experience tells us, however, that we should be rash to take anything for granted in such matters, the wish is too often the father of the conclusion where this and other forms of new treatment are concerned The point is especially deserving of emphasis in the present connexion, not only because of the remarkable relief which rest alone brings to anginal patients, but because the case reports in question so often conspicuously fail to convey a hint that this factor of rest has been taken seriously into account

It is not my desire to bring forward the point in the form of destructive criticism, but in the hope that future reports of the kind may provide evidence of a conclusive kind bearing on the rest factor —I am, etc,

THOMAS LEWIS,
University College Hospital Medical School

OBSTETRICS AND LOCAL HEALTH AUTHORITIES

SIR,—Owing to the great advances which have taken place in obstetrics in recent years the present system of administration by the local health authority demands careful consideration The towns, and by degrees the rural districts, are being supplied by midwives who are highly trained and kept informed as to modern methods by intensive courses of post-graduate lectures delivered each year in various centres

As a result, a highly skilled body of specialists is gradually emerging On the other hand, the clinical training of most medical undergraduates is lamentably deficient, nor can the hard-worked general practitioner afford time for post-graduate study of what is, after all, only a branch of his daily work, and in many instances a harassing and unremunerative one Few facilities for practical work in midwifery are available in British hospitals for qualified practitioners The difficulties are accentuated by the importance and rapid growth of ante-natal precautions requiring specialized knowledge and involving fresh responsibilities At present over half of the confinements are attended by midwives, a fact which proves a due appreciation of their services It remains to be seen whether this

proportion will not increase if the obstetrical training of the medical student is not improved and the rank and file of the profession do not advance with the times

The inspectors of midwives are under the direction of the medical officer of health for the supervision of midwifery nursing in their respective districts but take no part in nursing confinements The regulations of the Midwifery Board prescribe that in abnormal cases the midwife must call in a medical practitioner and in necessitous cases his fee is paid by the local health authority There is no provision ensuring that the doctor engaged shall have any special knowledge of the subject nor is he under any official obligation to furnish a detailed report of his treatment and the medical officer of health has no power to criticize

I suggest (1) That in the event of new appointment taking place for qualified medical inspectors of midwives those candidates who have had special training in practical obstetrics should be appointed and that their services should be obtainable for cases of abnormal labour or complications in the puerperium these practitioners would be under the direction of the medical officer of health and their scope immensely widened (2) That the whole-time officers should also supervise the ante natal work which should be a branch undertaken by the obstetrician rather than the child welfare medical officer (3) That in difficult cases except in those of urgent necessity the midwife should be required to invoke the assistance of (*a*) the medical inspector or (*b*) a practitioner ascertained by some competent authority to be a reliable obstetrician (4) That in every centre, when possible the services or advice of an experienced specialist should be available for serious complicated cases

The importance of the question is manifest Each year 700,000 children are born in this country It is difficult, even for the medical profession to realize the terrible legacies of ill health for mother and child due to unskilful or impatient midwifery At present the public have no idea of the facts but they are learning and it is the duty of those responsible to revise their methods —I am etc

TREATMENT OF GOITRE

SIR —The editorial article upon the iodine conditions in enlarged thyroid (September 20th p 528) is very interesting In general practice here in Hockley Birmingham I have been struck by the fact that the thyroid enlargement has at once regressed under treatment by sodium salicylate Iodine as potassium iodide sodium iodide syrup ferri iodidi may have been given by the mouth linimentum iodi fort and unguentum iodi denigriscens may have been used also but sodium salicylate has always been followed by a lessening of the goitre Bromide may be given occasionally Especially since National Health Insurance has come in has the good effect of a salicylate mixture been noted

The mistura sodii salicylatis of the Health Insurance Formulary Group "I" on continuous administration has always been followed by improvement, and usually by cure unless I am mistaken Patients are told they must come for over a year and the mistura sod sal is prescribed at once Some do not continue but those that do show the great benefit of the treatment The prescription is

Sod salicyl	gr x
Sod bicarb	gr xx
Ammon carb	gr iij
Mist menth pip	ʒ s

Sig t d s

If this is given with success where is the iodine? How is its lack made up Is there always a real lack of iodine — I am, etc

Hockley Birmingham Sept 2nd JOHN W DUNCAN

IODINE AND FOOD

SIR —The work of McClendon and Hathaway to which you devoted a leading article in the JOURNAL of September 20th (p 528) is of very great interest It is useful to know what vegetables and fruits contain most iodine, and in what parts of them it is stored Our standard bread and wholemeal enthusiasts will be stimulated to renewed efforts when they know that the part of the grain which contains a high trace of iodine is the part we give to the pigs

In districts however which are far from the seaboard, or in valleys lying at right angles to the prevailing moist wind to depend on so selected food as a means of preventing goitre will be trusting to a broken reed When the soil, and the water which irrigates it, is devoid of iodine the vegetation which it produces and the animal life which feeds on that vegetation, will suffer from iodine deficiency The soil cannot give what it has not got and in these places iodine must be supplied from other sources

You say The iodine deficiency theory is attractive at first sight, but there are many matters which cannot be explained on this theory alone" It is true we have still much to learn but we do not know everything about anything and in the sentence I have quoted I intended to suggest that no practical use ought to be made of the knowledge we possess until all the microscopic facts in the iodine deficiency theory have been explained away We may for a very long time have to wait and watch thousands upon thousands of our girls blooming into womanhood with this neck disfigurement and its associated disability In some schools in Derbyshire one girl in every five has a goitrous neck The evidence we possess that iodine is a safe and certain preventive of goitre is sufficient to satisfy any reasonable mind The verdict of America is That of all diseases goitre is the most easy to prevent," and the experience of Switzerland confirms it

It will be a lasting disgrace to the medical profession if goitre continues to flourish in our midst Here in Derbyshire a determined campaign is about to be inaugurated having for its object the total disappearance of simple goitre Iodized salt both for table and household use, is now on the market Iodized tablets will probably be given in selected schools at weekly intervals and possibly in some cases the public water supply may be treated

The claim made by the American investigators that exophthalmic goitre is also due to iodine deficiency contains only a small element of truth In simple goitre the enlargement is the response of the organ to natural stimulation Iodine plays several parts in the chemistry of life It has metabolic reproductive germicidal and toxin destroying uses and each department so to speak in ever-varying degrees draws on the thyroid for its requirements When the combined demand reduces the store of iodine in the gland below a certain level enlargement takes place In exophthalmic goitre however the stimulant is abnormal and bears no relation to the physiological need Moreover some of the other endocrine glands are whipped up in a similar way and also increase in size We can have Graves disease without any enlargement of the neck and there is reason to believe that in the early stage of the complaint if the supply of iodine is plentiful or if it is administered medically the gland will remain normal in size I do know that in recent cases the goitre does disappear sometimes be made to drop out of the picture by large iodine Of course the real disease remains The explanation appears to be that in these acute cases of Graves disease the abundance of iodine enables the gland to respond to the abnormal stimulation without losing its enlargement While in Graves disease iodine may stop the appearance of one of its many manifestations I know of no evidence that would justify its description as a preventive —I am etc,

Clifton Bristol Sept 22nd J A GOODCHILD

ALOPECIA AREATA AND STAPHISMUS FAMILIAL GROUPS

SIR —Professor Tomkinson has made a most valuable contribution to a problem in which many are interested in his paper on the above subject in your issue of September 20th 1924 continuing the special investigations recorded in the JOURNAL of September 16th 1922 It is becoming increasingly clear that the correlation of a series of defects or peculiarities which have been noticed by various workers acting independently, is more than accidental, and that these

may look for some common causative element which may explain the association

This second paper with its careful description of two new groups of cases is of special significance because it takes account of what I have called the "Inman hypothesis" There is, however, little evidence of left-handedness and stammering Perhaps Professor Tomkinson has not realized that to obtain the association between these factors to which Inman has drawn our attention the family history needs to be more closely investigated In my paper which he quotes on "Squint and the child mind" (*The Child*, January, 1924) he will see in the tables that left-handedness is much more common in grandparents, uncles and aunts, than in nearer relatives, and that it is not common in the squinters themselves The object of that paper was to point out that squint in particular was usually associated with some temperamental trait which it was important to recognize, and thus that a valuable clue may be obtained as to the existence of mind disturbances which it is important to correct

Those who are interested should read Inman's article (*Lancet*, August 2nd, 1924), entitled "An enquiry into the origin of squint, left-handedness, and stammer" They will find there a number of instances of the relation of these conditions to emotional causes When, however, this term is used it should be realized that any kind of mental trauma, such as that described in the case of Dr X in Professor Tomkinson's article, may be sufficient to produce a squint Inman refers to the element of fear and deals with this in connexion with whooping-cough, I would couple with this measles, which more than any other disease is connected by mothers with the origin of squint

"Hereditary squint" is a term which may have more than one meaning but in my view it is the temperament which is transmitted which indirectly may predispose to squint or other allied conditions The association of alopecia areata with squint, left-handedness, and stammering, if, as we believe, it is linked with all three, is not so easy to explain as the interrelation of the other conditions, which may all be regarded as habit reactions

A hint may perhaps be obtained from the first group of Professor Tomkinson in which the mother of the family had suffered from 'anaesthesia" An anesthetic patches are a common symptom in certain conditions usually called hysteria, and it may be that the bald patches are due to corresponding interference with the trophic nerve elements of the skin

It is greatly to be hoped that other observers will follow out the line of inquiry suggested by Professor Tomkinson's paper —I am, etc

London E C 2 Sept 26th CHARLES F HARFORD

TREATMENT OF PUERPERAL SEPSIS

SIR,—I have read with great interest the correspondence on the above subject, and would like to state the methods I adopt when dealing with this alarming complication

In the first place, I strongly condemn the use of either a sharp or a blunt curette If it is certain that the uterine cavity is the focus of infection, I have the patient anæsthetized and placed in the lithotomy position I then thoroughly examine, so as to exclude the presence of a pyosalpinx I then insert a speculum and thoroughly cleanse the vagina with plain water I then take an intrauterine swab, for examination and autogenous vaccines I then examine the uterine cavity without damaging the wall, and with the gloved finger alone, removing any purulent debris (such as pieces of membrane and blood clot) which may be present I then give a large intrauterine douche (lysol) I then seize the cervix with a vulsellum and thoroughly swab the whole of the interior of the uterus with pure tincture of iodine Lastly, I swab the vagina and perineum with iodine and give an intramuscular injection of pituitary extract The patient is then returned to bed and, as soon as possible, placed in as upright a position as is compatible with comfort

I have had excellent results with this method, and am placing it before your readers either as a help or for comment If the condition does not rapidly improve I give subcutaneous injections of streptococcal polyvalent serum—25 c.cm every twelve hours for three doses—and then, if necessary, the autogenous vaccines made from the swab —I am, etc,

Dunstable, Sept 20th D A BROUN

CELLULOSE ACETATE

SIR,—An article headed "Acute poisoning by fumes from cellulose acetate," by Dr Godfrey Carter, in your issue of September 13th (p 456), has no doubt given rise to considerable misconception in the minds of those readers who are not intimate with the properties of cellulose acetate

First, cellulose acetate is a solid substance resembling ground cocoa-nut in appearance, and under ordinary atmospheric conditions cannot possibly "fume"

Secondly, cellulose acetate is a definite chemical substance made by combining cellulose (cotton) and acetic acid, it is most certainly not a mixture of the various organic liquids mentioned It is not poisonous, and therefore cannot have caused the symptoms described

Thirdly, to put the matter in its true perspective it should be explained that cellulose acetate, like collodion or resin, can be dissolved by certain volatile liquids like acetone, and such a solution, if spread out and allowed to evaporate, will leave a transparent harmless film of cellulose acetate Sometimes, however, in order to cheapen the solutions, organic diluents such as methyl alcohol or benzine are added, also, to ensure clear films under all atmospheric conditions, it is customary to add small quantities of "heavy" solvent Originally tetrachlorethane was used for this purpose in aeroplane dopes (that is, solutions of cellulose acetate used for tautening and waterproofing aeroplane wings), but its use was prohibited by the Home Office in 1916, following the cases described by your correspondent Tetrachlorethane was replaced by benzyl alcohol, another "heavy" solvent for cellulose acetate, having incidentally local anæsthetic and antiseptic properties Since then aeroplane dopes have been quite safe

In the particular case under discussion it is therefore clear that cellulose acetate was not the poisonous ingredient of the solution Tetrachlorethane may possibly have been present The acetone found in the urine was probably absorbed as such by the system, but was not necessarily connected with the cyanosis If benzine or methyl alcohol or both were present as diluents they may have been contributory factors —I am, etc,

SIDNEY A WELCH, B Sc, A I C

Spondon near Derby, Sept 22nd

SIR,—Dr Godfrey Carter's article contains several inaccuracies He attributes to cellulose acetate noxious properties of which that body is entirely innocent Cellulose acetate is non-poisonous, very stable, odourless, and non-inflammable and indeed cannot emanate fumes

Mentioning some of the chemical substances with toxic properties used during the late war, Dr Carter states

> "Among them I would name trinitrotoluene and cellulose acetate The latter is extensively used as a varnish for aeroplane wings It is a mixture of benzine acetone, methylated alcohol, and tetrachlorethane forming a colourless liquid which gives off a heavy pear like odour"

This is an extraordinary statement, as cellulose acetate is in no sense a mixture of the substances mentioned It is not a liquid but a solid, bearing a strong resemblance to grated wood pulp It is a stable compound, obtained through the action of acetic anhydride and acetic acid on cellulose (cotton or wood-pulp), and its name indicates its composition it is a combination of cellulose with acetic acid

The writer of the article incriminates cellulose acetate, whereas it is the solvents employed to make an acetate of cellulose varnish which possess the toxic properties A mixture of benzine, acetone, methylated alcohol, and tetrachlorethane is not acetate of cellulose, although such a mixture might be used to dissolve the latter body —I am, etc,

London S W Sept 23rd M T CALLIMACHI, D Sc

SIR,—I read in your issue of September 13th an article on this subject which raises points of orthopædic interest. The technique of cellulose splinting, without preliminary plaster cast, which I advocated in the *Lancet* and brought to the notice of the British Medical Association Orthopædic Section at Bradford was based on work for over a year on more than fifty cases without any ill effect to any patient or myself or others who assisted at the work. May I also point out that the solutions 25 and 26 I use from the British Celanese Limited, do not contain tetrachlorethane as the writer supposes. Sir W. Willcox's paper in the *Lancet* (1915) and also Dr. Lees (*Lancet* 1916) were on poisoning purely due to tetrachlorethane, and jaundice was a constant symptom. The experimental work of Willcox on animals with cellulose acetate in solvents like acetone, benzene, methylated spirit and in tetrachlorethane respectively showed that the last solvent caused severe drowsiness. Being a heavy spirit tetrachlorethane accumulates close to the ground and may cause toxic effects in certain susceptible individuals. By an extractor and electric fan such accident can be avoided.

Cellulose acetate itself is a non-poisonous substance. It is cotton dissolved in acetic anhydride washed free from acid, shredded and ground. The solvents in the solution I advocate only contain acetone, alcohol and benzol. This has been verified from the maker this week. The word "dope" used during the war was essentially for tetrachlorethane preparations. The Celanese Company assure me they have had no reports of any bad effects from the use of solutions 25 and 26 which are also made use of for artificial limbs and in artificial silk weaving.

As to my personal experience I have made all the splints myself for children and adults of practically all the joints of the body, and for immobilizing bilateral phthisical chests without any toxic effect on the patients. Only two of the nurses who assisted me had attacks of slight headache. None of the others had any headache, as I work with an electric fan in a well ventilated room. To get over the odour of acetone we used to wear a face mask which was discontinued. It can be rendered less noticeable by dilution with camphor or other substitutes. Regarding the possibility of acetone being the agent of poisoning, the strength used is less than that in use for celluloid splints as made at Alton or Carshalton. Through the courtesy of Dr. Pugh I personally witnessed his technique and he also takes the usual precaution to aerate the room, etc. Occasional diarrhœa and indigestion in one or his nurses were the only ill effects.

I notice that in Sheffield vaseline was used which I did not advocate. I use oilsilk stitched tightly next to the skin inside the vest to prevent any absorption or fumes by the body, also the celastoid film before bandaging and painting with solution adequately protects the patient. The dexterity one soon acquires completes the cutting stage of the splint, especially in a child, in fifteen or twenty minutes. In fact, a few layers are quite enough to maintain the mould, which can be completed out of the body at leisure.

Those who have watched the celluloid process of splint-making cannot but admit the direct method is simpler and more economical. I therefore maintain that the Sheffield experience of temporary coma with acetonuria was one of exceptional susceptibility in a child probably weakened by tuberculous disease. Individual idiosyncrasy is a factor which must be prepared for in other lines of work. Dr. Martin of Leasowe reports occasional acidosis in the Surgical Tuberculosis Hospital.—I am, etc.

Leeds, Sept. 26th. Z. P. FERNANDEZ, M.D., D.P.H.

THE VALUE OF FRUIT AS A FOOD

SIR,—"S. J. T." (in your issue of September 20th, p. 542) asks for some practical advice as to the nature and amount of the constituents of a fruitarian dietary and to what extent the usual porridge, meat, milk pudding, etc., are to be replaced.

In the first place I would refer him to the investigations and observations of Dr. Jaffa, Professor of Nutrition in the University of California.[1] He showed that a vigorous university student, aged 22 and a prominent athlete, maintained his nitrogen balance in equilibrium upon a daily diet of either 5½ lb. grapes, 6 oz. walnuts and a little bread, or 4½ lb. apples, 8 oz. dried peas and 4 oz. almonds, or 3½ lb. apples, 9½ oz. dates, 6 oz. peanuts with a little milk, olive oil and tomato, or 5½ lb. pears, 7 oz. walnuts, a little bread and milk, or 16 oz. walnuts, 12½ oz. prunes and 18 oz. oranges. From this it is clearly evident that the ordinary meal that a man gives up to eat he must eat a great deal more to make up for the loss in calories.

The ordinary dietary of people in civilized communities is in excess of their requirements and one of the most valuable methods of preventing the excess of the protein intake is to put a patient upon a fruitarian diet. Professor Jaffa observed two of his fruitarian children, of 6 and 9, their thoroughness of digestion and absorption was equal to that of an ordinary adult, and assimilated in that they digested 80 per cent. of the nitrogen ingested.

My own observations upon several thousand patients who were ill and of people who were well have been that the immediate and sudden substitution of a fruitarian dietary has been generally beneficial and in high percentages of cases markedly so. The advice that I have found the simplest to give where patients had to feed at home was simply to continue their ordinary diet, but omitting all flesh food and adding a daily dish of salad with oil and vinegar and a plate of any fruits in season. Specifically I have found it generally helpful to add 1 lb. of raisins, ½ lb. of cheese, a couple of eggs and 1 lb. of nuts per week. The nuts should be ground in a mill and the raisins should be soaked in cold water for twenty-four hours.

The general effect of such a dietary is to increase the alkalinity of the blood, decrease the acidity of the urine, replace constipation by a normal functioning and slightly increase diuresis.—I am, etc.

London, W., Sept. 24th. JOHN OLDFIELD.

TREATMENT OF FROST-BITE

SIR,—In modern textbooks of surgery written or edited by British surgeons certain subjects for which the authors have little or no experience must be included if the book is to embrace this comprehensive subject. Naturally information with regard to these subjects must be gleaned from other textbooks if no authoritative article has appeared in recent literature. Consequently one new textbook follows another often repeating the same old story more or less paraphrased. Thus one sees the treatment of frost-bite almost similarly dealt with in the last edition of Choyce and Beattie's *System of Surgery* and in Cantlie's *First Aid to the Injured*. In both it is suggested that the frost-bitten part should be rubbed with snow, ignoring the fact that a frost-bitten nose or other extremity is anæsthetic and easily abraded or scratched by grit in the snow or even by a hard fibre in the glove. Again, snow in the neighbourhood of the assumed conveniently warmed room is almost certainly contaminated, also the act of picking up the snow will result in wetting the gloved hand, and in the presence of moisture the fingers will soon share in the frost-bite.

In the late British expedition to North Russia it was found necessary to issue orders to medical officers and combatants forbidding men adopting these measures. Alternative suggestions for treating early frost-bite were at the same time circulated. These suggestions were drawn up after I believe consulting Majors Marshall and Macklin both of whom had had experience as medical officers to antarctic expeditions. As regards the treatment of frost-bite Lieut.-Colonel D. C. L. Fitzwilliam, one of the authors of Choyce and Beattie's *Surgery*, read a paper in Archangel to the allied medical officers on the use of paraffin in the later stages.

It is time that British textbooks on surgery scrapped many dangerous and ridiculous suggestions and instead gave information as to prophylaxis and early and late treatment of a condition which if neglected frequently results in serious maiming.—I am, etc.

Somerset House, Sept. 26th. T. H. PICKERILL, F.R.C.S.Ed.

[1] Bulletin 142, U.S. Department of Agriculture.

MEDICAL OFFICERS AND CONSULTING FEES

SIR,—Dr Barford tells your readers that it has been his custom in the past to reply to remarks from those only who sign their names I cannot help feeling that Dr Barford's friends, if not Dr Barford himself, will regret that he departed from his custom on this occasion Such argument as can be extracted from his letter is, of course, all in favour of my contention I quite agree with him and with 'Whole Time," in your issue of September 20th, that lay committees have sometimes appointed inexperienced young graduates to these responsible posts This all needs putting right But will the recommendation of the Representative Body at Bradford help or hinder in the process?

With regard to fees, I can assure Dr Barford that I do perhaps a hundred free consultations for every one that involves a fee But I am not prepared to relinquish the right to take a fee, and a substantial one, when offered me by another medical man who calls me into consultation concerning a private case outside my official duties

In the matter of anonymity, I believe the Ethical Committee of the Association would agree with me in thinking that letters such as this and my former one are better unsigned Doubtless, Mr Editor, you will see to it that neither Dr Barford nor I abuse the hospitality of your columns Such action as I can take within my Division of the Association will not be taken anonymously —I am, etc,

September 27th TUBERCULOSIS OFFICER

GALL STONES AND CANCER

SIR,—One of your correspondents last week, being satisfied that certain "brilliant experiments" have indubitably demonstrated that cancer can be caused by simple mechanical irritation, thought it only remained to show *how* mechanical irritation can produce cancer, and then the tale would be told When the premisses of a proposition are wrong the conclusion is also wrong, therefore it cannot possibly be shown *how* irritation of any kind can produce cancer, despite the most "brilliant," and equally unnecessary, experiments That cancer *follows* mechanical irritation of all kinds no one has ever doubted Irritation has always been closely associated with the disease, although it has not been found to precede it in all cases

Cancer has never been *caused* by mechanical irritation, and cannot be, because it is a specific disease This is proved by the fact that it is self-infective and transmissible *from* one individual *to* another Its transmissibility is proved by countless successful laboratory experiments on the lower animals, and by observed cases in human beings, both directly from one to another, and indirectly by inanimate objects

At the same time irritation, from whatever cause, is a most potent predisposing factor, and that is its role It prepares the soil most admirably for the reception of the causal agent, just as irritation of the soil by ploughing, harrowing, etc, prepares land for the reception of seed, but if wheat, for example, is not sown, there will be no crop, however thorough the preparation has been So with cancer, unless the causal agent is present, there will be no disease, however great the irritation

Before any alleged cause of a disease can be accepted as the true one, it is imperative that it shall be present in every case, wherever occurring, without exception Since cancer is as truly a specific disease as leprosy or tuberculosis, it is obvious that the cause must also be a specific one and present in every case All specific diseases are caused by toxins generated by their respective specific micro-organisms, and therefore it is only reasonable to assume that cancer is caused by the toxin of a micro-organism Has any such been discovered? Many observers have asserted that they have discovered one—for example, Scheuilen, Doyen, Jackson Clarke, Ford Robertson, Young, and lately Glover of Toronto

Glover asserts that he has not only discovered a micro organism which he believes to be the cause of cancer, but he has cultivated it and found it to fulfil in its entirety, the law of Koch, and *this has never been done before* He has gone further, and has produced an antitoxin which he has found successful On July 9th last he addressed the Clinical Association of Philadelphia at which meeting were present 700 medical men from the United States and Canada He stated that he had been able to isolate from every type of carcinoma a specific micro organism which, when inoculated into healthy animals, produced the disease Afterwards he had been able to recover the organism from these animal and had been able to immunize healthy animals against the disease From the blood of a large percentage of cancerous patients he had obtained pure cultures He described the organism, which is a bacillus It forms spores like cocci, and is motile It produces a toxin which induces the remarkable proliferation of cells so characteristic of cancer This toxin he had injected into healthy horses, and from them he had prepared an antitoxin in the same way that diphtheria antitoxin is prepared He exhibited under the microscope the living organism in the various stages of its life cycle

At the same meeting Dr Warmuth of Philadelphia gave an address confirming Dr Glover's discovery and experiments, all fully completing Koch's cycle of events He had experimented with Dr Glover's antitoxin for more than eighteen months with very gratifying results He had succeeded in making blood tests found to be reliable in 100 per cent of cases, by which it will be possible to recognize the disease at its very beginning, even before any local manifestation The antitoxin was not claimed to be a "cancer cure" but a treatment for cancer which is remarkably successful He enumerated many cases of successful treatment, entering into details of exhibition of the serum, dosage, etc

I would suggest that your correspondent direct his attention to the really brilliant experiments of Dr Glover, which have had such successful results, and then he will not have occasion to consider impossibilities —I am, etc,

Driffield, E Yorks, Sept 27th A T BRAND, M D, C M

ALCOHOL AS A NARCOTIC POISON

SIR,—I feel that until it is realized that it is in the abuse of anything that poisonous results follow, the point will never be settled Many of our everyday foods and drinks may as truly be regarded as noxious when over indulged in Nothing more surely poisons than too much meat eating, over-smoking, and so on

Alcohol in its proper sphere is a useful and refreshing adjunct to our internal economy I admit that severe penalties must be meted out to fools and reckless people who endanger the public The worker likes his glass of beer or his pint, and is better and happier for this, others who can afford it benefit by whisky and soda—but the price!—I am, etc,

CIVIL CONSULTANTS TO THE NAVY

THE following civil consultants to the Navy have been recently appointed by the Admiralty

Sir Humphry D Rolleston, Bt K C B, M D, F R C P, to be Consulting Physician to the Royal Navy

Arthur Edmunds, C B, M S, F R C S, to be Consulting Surgeon to the Royal Navy

C Hubert Bond, C B E, M D, D Sc, F R C P, to be Consultant in Mental and Neurological Diseases to the Royal Navy

VOLUNTARY AID DETACHMENTS

THE scheme for voluntary aid detachments, which has been approved by the Army Council, is designed to supplement the medical services of the naval, military and air forces in the event of war or other national emergency in any part of the world On the outbreak of war the personnel of the detachments, which are a technical reserve of the forces of the Crown, would be required for motor ambulance convoys, ambulance trains, general, naval, military, and air force hospitals, auxiliary hospitals, rest stations, hospital ships convalescent homes command depots, entraining, detraining, embarking and disembarking sick and wounded

Under the War Office, which is the supreme authority in the movement, a Central Joint Voluntary Aid Detachment Council has been formed, with administrative and executive powers within the limits of the scheme

The position with regard to Wales has been fully considered, and the council has appointed a Welsh committee with full powers to act on its behalf Major General Lord Treowen C B C M G, is chairman, and Sir Herbert D W Lewis, K B E, secretary Both are members of the central council

Nominations submitted by the Territorial Army Associations for appointment as county controllers as agreed to by the Order of St John and the British Red Cross Society, were confirmed, and provision was made for the appointment of assistant county controllers, one to be nominated by the order and one by the society

The county controller is the chief executive officer for voluntary aid detachments in the area He is appointed by the association in agreement with the order society and council

Voluntary aid detachments may consist of either men or women but not of both They are divided into two classes—mobile to go anywhere and immobile, to work in the neighbourhood of their own homes Every member of mens and womens detachments must pass an annual efficiency test and all members must attend the annual inspection

Obituary

SIDNEY MARTIN, MD, FRCP, FRS,

Senior Physician and Professor of Clinical Medicine University College Hospital

We had to record with regret last week the sudden death, on September 22nd, of Dr Sidney Martin, renowned for his pioneer work in experimental pathology

Sidney Harris Cox Martin was born in Jamaica on April 8th, 1860, and was educated at University College, London, and in Vienna He obtained the diploma of MRCS in 1882, and in 1883 graduated MB, BS Lond, winning the university scholarship in medicine and taking honours in surgery he proceeded MD in 1884 In 1885 he obtained the MRCP diploma, and in 1891 was elected FRCP His early appointments included those of pathologist, curator of the museum, and medical tutor at the Middlesex Hospital and pathologist and registrar to the City of London Hospital for Diseases of the Chest

In 1890 when Dr Martin was assistant physician at both University College Hospital and the Brompton Hospital for Consumption, a Royal Commission was appointed to investigate the effect of food derived from tuberculous animals on human health, and the circumstances and conditions with regard to the tuberculosis in the animals concerned Dr Martin was requested by the Commission to undertake an inquiry into the influence on lower animals of food of tuberculous origin A very careful and exhaustive plan of research was devised, including both inoculation and feeding experiments, and his lucid report takes up 96 pages of the appendix to the first report of the Commission published in 1895 Dr Martin's main conclusion that food from a tuberculous source endangered a healthy animal was held by the Commission as proved He also laid emphasis on the probability that health tissues in a tuberculous animal would often be contaminated by the butcher's instruments conveying infection from elsewhere during the processes of flaying and dressing In his feeding experiments tuberculosis did not result when the meat used was taken from cows with mild or moderate degrees of tuberculosis, and the deduction was drawn that it was conceivable that a considerable part of an infected animal might be used for food if the tuberculosis was localized and sufficient care and discrimination were exercised in the slaughter house it was held, however, that in cases of generalized tuberculosis all the meat should be condemned Taking into consideration Dr Martin's experiments and certain other researches, the Commission came to the conclusion that probably an appreciable part of human tuberculosis was traceable to food In the same year in which the report was published Dr Martin was elected a Fellow of the Royal Society

Dr Martin had a prolonged and intimate association with the Royal College of Physicians In 1892 he delivered the Goulstonian Lectures on the chemical pathology of diphtheria compared with that of anthrax infective endocarditis and tetanus (BRITISH MEDICAL JOURNAL vol i 1892) In these lectures he emphasized the importance of further investigation of the poisonous products of the infective organisms In 1893 he delivered the Croonian Lectures on the chemical products of pathogenic bacteria considered with special reference to enteric fever (BRITISH MEDICAL JOURNAL, vols i and ii, 1893) In 1915 he delivered the Lumleian Lectures on non ulcerative infections of the colon He was a member of the Joint Committee of the Royal Colleges of Physicians and Surgeons in charge of the research laboratories on the Thames Embankment from 1901 to 1905 He was an examiner in medicine for the Joint Board of the Royal Colleges from 1907 to 1910, a member of the Council of the Royal College of Physicians in 1910-11, censor in 1915-16 and representative of the College on the Senate of the University of London in 1919 He was one of the original representatives of the College on the Imperial Cancer Research Fund from its foundation in 1902 until his death and he became chairman on the retirement of Sir William Church last year He was a member of the Advisory Committee of the Royal Colleges, known as the Committee of Reference, appointed in March, 1916 with reference to numbers of the staff of hospitals in the metropolitan district required for service in the army and was chairman of the Hospitals Appeal Subcommittee

Other addresses delivered by him included the Lettsomian Lectures in 1899, on functional derangements of the small intestines (BRITISH MEDICAL JOURNAL, vol i, 1899) and in the same year he delivered the Hunterian Lectures on certain intestinal parasites of the intestine, reported in our columns (vol ii 1899)

Dr Martin was formerly assistant secretary of the British Medical Association and one of his earliest papers included in a paper on the pathology of the blood read before the Section of Pathology of the British Medical Association in 1890 and published in our columns (vol i 1891) He was secretary of the Section of Pharmacology and Therapeutics of the Annual Meeting of the Association in 1883 when it met in Glasgow and vice-president of the same Section at the Annual Meeting in Nottingham in 1892 In 1895 he produced a *Text-book on Functional and Organic Diseases of the Stomach*, and then, turning his attention to the antitoxin treatment of diphtheria, published two papers in our columns (vol i, 1896, and vol ii 1898) In 1903 he published a *Text-book of General Pathology*, which was not only useful popular as a compendium for students, but also for its brief and complete summaries of various subjects He contributed accounts of tuberculosis and poisoning by food to Allbutt's *System of Medicine* and other articles by him are published in Quain's *Dictionary of Medicine* and Gibson's *Text-book of Medicine*

A Tribute by a Colleague

Men in great place are thrice servants: servants of the sovereign or state, servants of fame and fortune, and servants of business

By the sudden and unexpected death of Dr Sidney Martin British medicine has suffered an irreparable blow and University College Hospital has lost an ideal physician He certainly was a man in great place and he served but did not publish the fact on the housetops To have served on two Royal Commissions on Tuberculosis and to have held office on the Imperial Cancer Research Fund alone prove that he was a servant of the sovereign or state, to have published most important papers on scientific medicine, to have delivered Goulstonian, Croonian, Lettsomian and other public lectures, and to have held the professorship of pathology in University College and the lectureship in medicine at University College Hospital Medical School, prove that he has been a servant of fame, and to one who has had the privilege of working with him for years on the staff of a hospital which has gone through unique vicissitudes he will always remain the incomparable servant of business

It seems unbelievable that this quiet, companionable man, who could play such excellent golf, should also be able to discharge so successfully the difficult tasks of scientific investigator, of practical teacher of medicine of superb chairman of scientific or business committees, and of successful consulting physician During the war he discharged the exacting duties of his own and others at University College Hospital, and worked assiduously in the difficult work at the Third London General Hospital, and at the same time and without remission served upon important and exacting committees of the Royal College of Physicians

Then came the period of reorganization at University College Hospital which followed after the war When others felt resentment at much of the change which was said to be imperative Sidney Martin faced the new position, and by his common sense and adaptability made rough ways smooth, even to returning to take his share as a full physician of many years' standing in the work of out-patient physician, indeed he took a leading part in the curious but most salutary change by which all physicians to the hospital should have charge of in- and out-patients

Medical students are notoriously good judges of the members of the staff of their hospitals, Sidney Martin got through the ordeal from first to last as the 'great little man," the sound physician who had no axe to grind, and impressed the patients, nurses, and students with 'quiet confidence" in his skill and good judgement None would

claim that he was brilliant as a lecturer or teacher, but all sought his assistance in difficulty, knowing that beyond his opinion there was no other

University College Hospital has been fortunate in the past in its possession of devoted sons who have worked for the good of the place, and has never been more faithfully served than by Sidney Martin no one has given more of his best, and, must it be confessed, no servant of the sovereign or state, of fame, and of business had received less public recognition, his high character and superb abilities in an even harness from the beginning right up to the end The one stimulus he seemed to ask for was the work in front of him, however arduous, and not the reward so many who worked with him hoped would follow upon his labours for the institution, whose high principles he had so close at heart Reward—and it is extremely doubtful whether he needed any other than the right to enjoy the good things already allotted to him—was not his object It was sufficient to him to have commanded the respect and esteem of his peers in science and generations of "University" men This was fully shown by the large and representative attendance at the memorial service, held last Friday at the Church of St Marylebone for this "man in great place," whose character owed so much to a rich blend of honesty and kindliness

DANIEL BIDDLE, M R C S, L S A,

Kingston on Thames

MR DANIEL BIDDLE of Kingston-on-Thames, who died on September 14th at the age of 84, was a man of very varied attainments He was a son of Lieut.-Colonel Biddle of the Madras Artillery, was born in Gloucestershire, and educated at Taunton He studied medicine at the Somerset County Hospital and at St Thomas's Hospital, London, where he was house-surgeon in 1862 He then became a general practitioner at Kingston-on-Thames, and carried on a large practice for over fifty years He was also well known as a mathematician, and for some years was mathematical editor of the *Educational Times* His interest in statistics led to his being asked to assist in the preparation of the report by the Statistical Committee of the General Medical Council in 1885, and the statement in that report, that the Registrar had "availed himself of the valuable co-operation of an able and accomplished statist," refers, no doubt, to Mr Biddle Further reports were issued in 1886, and the extraordinary fullness of these and of the tables which were published with them in the minutes of the General Medical Council show how enormous must have been the work of compiling the statistics

Mr Biddle took an active part in opposing the dual system of notification embodied in the Infectious Diseases Notification Act of 1889, he helped to form the Thames Valley Medical Association, and was interested in the work of the British Medical Association In addition to his medical activities, Mr Biddle found time for interest in chronautics, and invented a balloon, he wrote pamphlets on geneological and theological subjects, he was a strong advocate for legalizing marriage with a deceased wife's sister, he wrote many articles on the question of harnessing the tides, he published a system of shorthand

Mr Biddle has been described as a doughty fighter in any cause that he took up Withal he retained the affection and esteem of his many patients, while the variety of his interests and activities must have given him a broad outlook on life and have increased his power in the practice of medicine

DR PATRICK JAMES QUINLAN, who died on September 6th, received his medical education in Dublin, where he obtained the diplomas of L R C P I, L R C S I, and L M in 1891 Dr J Mills, the resident medical superintendent of the Billinasloe District Asylum, writes It is with the deepest regret that his colleagues in the county of Galway heard of the death of Dr P J Quinlan, which occurred with tragic suddenness on the evening of September 6th He had been engaged in the heavy duties of a large practice and was walking home, when he suddenly collapsed, and died soon after He had been for some time in charge of the Kiltormer dispensary district, and had held the post of assistant medical officer of the Ballinasloe District Asylum, after which he was elected, some thirty years ago, to the Athenry dispensary district, where his kindly nature and genial manner rapidly secured for him an unassailable position and hosts of friends Always zealous and conscientious in the discharge of his duties, he won the approbation of the higher officials of the Local Government Board, and he associated himself in his spare time with the social life of the district He was a prominent and popular member of the famous Galway Blazers Hunt, and in his time trained many good horses In other forms of sport, such as shooting, tennis, and croquet, he was also well able to hold his own He was a member of a well known Tipperary family, and his house was a centre of hospitality Great sympathy is felt with his widow, who is the daughter of the late Dr Morris of Kilkenny, and his three young children His high ethical sense endeared him to his colleagues, who often profited by his wide professional knowledge, and now miss and mourn a high-minded gentleman and a loyal friend

DR FREDERICK ARNOTT STORR died on September 13th at his residence, Knowle Cottage, Mirfield, at the age of 59 He graduated B A Oxford in 1889, and after studying medicine at Leeds obtained the L S A diploma in 1894, and the D P H in 1896 Having held the post of assistant house-surgeon at Halifax Infirmary he practised for some years in Brighouse, and removed later to Mirfield In 1910 he was appointed medical officer of the Halifax Rural District Council and retained this appointment to the date of his death He was medical superintendent of the Elland and District Small-pox Hospital and honorary surgeon to the Mirfield Memorial Hospital, and during the war was commandant of the Military Auxiliary Hospital He was a member of the British Medical Association and a Fellow of the Society of Medical Officers of Health Severe illness in 1921, and again in the autumn of last year, necessitated amputation of the right thigh, and this misfortune led to an appeal being made on his behalf to members of the British Medical Association, which was published in our columns of September 15th, 1923 (p 488) The response to the appeal, combined with a generous grant by the West Riding Medical Charitable Society, rendered his last year of life very much more comfortable and less anxious than could otherwise have been the case

PROFESSOR BERTRAM WELTON SIPPY of Chicago, well known for his method of treatment of gastric and duodenal ulcer, died on August 15th of heart disease complicating diabetes, at the age of 58

DR ANDRÉ BERCÉ, a well known Paris cardiologist, has recently died, at the age of 61

THE LATE MR W B PATERSON

MR W A MAGGS whose tribute to the late Mr W B Paterson appeared in our issue of September 20th (p 546), desires to make a correction of detail The school at which Mr W B Paterson and Sir Frederick Treves, and Sir Frederick Hewitt were all the educated was Merchant Taylors, not the City of London School

Universities and Colleges.

UNIVERSITY OF LONDON

KING'S COLLEGE

A SPECIAL course of eight lectures on the histology of the nervous system will be given during the Michaelmas term (October—November, 1924) in the physiology lecture theatre of King's College (Strand, W C) by Dr C Da Fano, Reader in Histology in the University The lectures will be accompanied by demonstrations of specimens and will be held on Wednesdays at 4 30 p m, beginning October 8th The microscopical specimens will be exhibited one hour before the beginning of each lecture The course is free to all students of London colleges and to medical men and others on presentation of their visiting cards It has been recognized by the University of London as one of the special courses for the B Sc honours degree

UNIVERSITY COLLEGE

The following elections have been made in the Faculty of Medical Sciences at University College, London Bucknill Scholarship, value 160 guineas, D F Ogborn, exhibitions of 55 guineas each W A Wilson and H Temkin, Epsom Medical Scholarship R W Haines, additional scholarship, P A Cooper

Medical News

We regret to have to record the death of Mr W H A Jacobson consulting surgeon to Guy's Hospital well known to many generations of surgeons for his *Operations of Surgery* and also as the editor of the later editions of Hilton's *Rest and Pain* Mr Jacobson's death occurred on September 14th at his house in Kent, to which he had retired some years ago

Early this year we made a brief reference to the journal of the Kenya Medical Service, a modest periodical at that time issued to its subscribers in typewritten form Since April it has appeared monthly as a printed publication under the title of the *Kenya Medical Journal*, circulating throughout Kenya Colony, Uganda Tanganyika and Zanzibar Its function is the distribution of medical news of local or general interest and the discussion of problems appertaining to medical science The editorial conduct of this enterprising journal continues in the hands of Dr C J Wilson the publishers are the East African Standard, Ltd Nairobi The yearly subscription is twenty one shillings fifty cents posted, in Kenya, or twenty five shillings, posted outside East Africa

THE annual general meeting of the Society of Medical Officers of Health will be held at 1, Upper Montague Street, Russell Square, W C 1 on Friday October 17th at 4 30 p m when the new president, Dr J A Lyster will give his address on Idealism in public health The annual dinner of the society will be held at the Hotel Cecil Strand on the same evening at 7 30 The Minister of Health hopes to attend, and others who have accepted include Sir Humphry Rolleston P R C P, Sir George Newman Sir Arthur Robinson and Dr Haden Guest, M P A musical programme will follow the dinner Ladies are invited, and members are asked to give early notice to the Executive Secretary 1, Upper Montague Street, of their intention to be present with the names of their guests A payment of 12s 6d for each ticket should be included with applications sent before October 11th, after that date tickets will cost 15s

A SERIES of post graduate lectures on cancer will be delivered in the West Lecture Hall of the Royal Society of Medicine at 5 30 p m, commencing on October 6th when a lecture on the general pathology of cancer will be given by Dr Archibald Leitch, and on October 8th Sir Thomas Horder will lecture on cancer from a medical point of view These lectures are open to all members of the profession without fee The second week of the course in psychological medicine at the Bethlem Royal Hospital begins on October 7th lecture demonstrations will be given on Tuesdays and Saturdays, at 11 a m, by Dr Porter Phillips and Dr Thomas Beaton On the same day the first of eight clinical demonstrations on tropical medicine will be given at the London School of Hygiene and Tropical Medicine by Dr G C Low and Dr Manson Bahr at 2 p m the second demonstration will be given on Thursday at the same time On October 8th the first of four lecture demonstrations on electro therapy will be given at the Royal Free Hospital by Dr C L Heald at 5 30 p m Full particulars and syllabuses of all the courses may be obtained from the Secretary of the Fellowship of Medicine 1, Wimpole Street, W 1

DR JOHN JOHNSTON of Bispham, Blackpool has presented to the Bolton Reference Library his fine collection of the works of Walt Whitman whose friend he was Dr Johnston is the joint author of *Visits to Walt Whitman*, and his collection includes first editions of all Walt Whitman's works (many of them containing the poet's autograph) also all the important biographies and critical articles about him and his poetry Students and others will have access to the collection

SIR HILARIO MARCUS FERNANDO, M D, has been appointed a member of the Executive Council of the Island of Ceylon

In our issue of September 13th (p 482) Mr Wheatley, the Minister of Health was referred to as a former convener of the Public Health Committee of Glasgow We are now told that this is not strictly correct and that Mr Wheatley was convener of the Tuberculosis Committee the convener of the Public Health Committee having been Mr James Stewart, who is now Parliamentary Under Secretary of Health for Scotland

A RESEARCH into the harbouring of plague by wild rodents and the specific prophylaxis and therapy of the disease in man is being undertaken by the South African Institute for Medical Research Johannesburg The work is to be carried out largely in a mobile laboratory on the veld The present staff of the institute is to be augmented by a bacteriologist and an entomologist The conditions of the appointments are briefly stated in our advertisement columns, but full information, including particulars as to the salaries, can be obtained from the Director of the Lister Institute Chelsea Gardens, S W

At a meeting of the London Executive of the Labour party held on September 20th Dr Ethel George Bushill was adopted as medical officer of health for Finsbury, was adopted as the Labour candidate in the forthcoming parliamentary by election caused by the death of Sir Sydney Russell Wells The other candidates contesting the seat are Sir John Foster Fraser Conservative nominated by the Unionist Association Professor F Pollard nominated by the Liberal Association and Dr L Graham Little by the Graduates Association as a non political candidate At the general election in 1923 the total poll was 6,000 being divided Sir Sydney Russell Wells (Conservative) 2,767 Professor F Pollard (Liberal) 2,233, Mr H G Wells (Labour Socialist) 1,400 Polling takes place from Monday, October 13th till Friday, October 17th The writ has just been issued sent by the Vice Chancellor to all graduates on the parliamentary register The four candidates were duly nominated on October 1st

To commemorate the diamond jubilee of the Guild of St Luke a celebration of the Holy Eucharist has been arranged for St Luke's Day, October 18th at 11 a m in All Saints Church Margaret Street London W the sermon will be preached by Bishop Gore The annual service of the Guild will be held on the day October 21st in St Paul's Cathedral, at 7 p m the preacher will be the Bishop of Truro Tickets for this service may be obtained from the Hon Fairfield Whittaker, M D Chaplain's House Lane End Downs, Surbiton, Surrey, or Dr Dorothea Rooke 69 Park Road Baker Street, S W 1 The annual corporate Communion will be celebrated at St Andrew's Church Wells Street W 1 at 7 45 a m on Wednesday October 22nd and on the same day the annual general Chapter will be held at 25 Harrington Gardens S W, near Gloucester Road Station, at 5 p m, tea and coffee being served at 4 30

THE second session of the *Liverpool Psychological Society* will commence on October 7th, when the President, Dr Betts Taplin will deliver his inaugural address, on 'The Power of Suggestion,' at the University, at 8 p m The society's first session has been very successful, and an interesting programme of scientific research has been arranged for the coming winter Further particulars may be obtained from the Secretary, the University, Liverpool

A SPANISH Congress of Medical Science will be held at Seville from October 15th to 20th, under the presidency of Professor Teissons of Madrid

PARTICULARS for a revised edition of the *Fryer College Register* are now being collected Those who have received forms are asked to fill them in and return them to the sub-editors at once Any old Epsomian who has not received a form should send his address to Mr H F Lee 7 The Avenue, Feltham without delay

The annual meeting of the State Children's Association will take place on the invitation of Major Astor M P, and Lady Violet Astor at the Carlton House Terrace, on Friday, October 10th The chair will be taken by Lord Sandhurst at 3 p m Various matters relating to children supported by the state will be discussed

LORD CAVAN LEMOS writes to commend the Lord Roberts Memorial Fund for Workshops for Disabled Soldiers and Sailors This Fund which is an offshoot of the Soldiers and Sailors Help Society, has existed for many years and is devoted to helping all soldiers and sailors and not only those incapacitated in the last war Workshops were started after the South African war and were considerably enlarged as a memorial to Lord Roberts to accommodate cripples of the more recent war in them craftsmanship is taught and a market found for the work of disabled men since an injured man cannot compete with the uninjured being unable to work sufficiently long the memorial fund not only trains him and gives him work but also makes up the difference in money between the man's endeavour and his output Cheques may be sent to Lord Cheylesmore at the offices of the Fund 122 Brompton Road S W 3 they should be drawn in favour of the honorary treasurer of Lord Roberts Workshops Fund and crossed Lloyds Bank Ltd.

THE one hundred and fifty ninth annual session of the Pennsylvania University Medical School the oldest medical school in the United States opened on September 26th The school was founded by Dr John Morgan who held the first medical posts of his creation in the colonies and it still graduates have been registered

THE annual Belgian Congress of Professional Medicine was held at Ostend on September 6th and 7th on the occasion of the sixth anniversary of the Belgian Medical Federation Papers were read by Dr Wiedenhofer of Strasbourg on the evolution of the medical profession in Belgium, by Dr Lecorte and Penninckx on railway medicine and by Dr Koetritz on medical practitioners and club practice

Letters, Notes, and Answers.

ORIGINAL ARTICLES and LETTERS *forwarded for publication are understood to be offered to the* BRITISH MEDICAL JOURNAL *alone unless the contrary be stated* Authors desiring reprints of their articles published in the BRITISH MEDICAL JOURNAL are requested to communicate with the Financial Secretary and Business Manager, 129, Strand, W C 2, on receipt of proofs

ALL communications with reference to advertisements as well as orders for copies of the JOURNAL should be addressed to the Financial Secretary and Business Manager, 429, Strand, London, W C 2 Attention to this request will avoid delay Communications with reference to editorial business should be addressed to the Editor, BRITISH MEDICAL JOURNAL, 429, Strand, W C 2

CORRESPONDENTS who wish notice to be taken of their communications should authenticate them with their names—not necessarily for publication

Communications intended for the current issue should be posted so as to arrive by the first post on Monday or at latest be received not later than Tuesday morning

THE telephone number of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is Gerrard 2630 (Internal Exchange) The telegraphic addresses are

EDITOR of the BRITISH MEDICAL JOURNAL, *Aitiology Westrand, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc), *Articulate Westrand London*

MEDICAL SECRETARY, *Mediocria Westrand, London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street Dublin (telegrams *Bacillus, Dublin* telephone 4737, Dublin) and of the Scottish Office 6 Rutland Square, Edinburgh (telegrams *Associate, Edinburgh* telephone 4361, Central)

QUERIES AND ANSWERS.

INCOME TAX

Partnership Capital

"S L" entered into partnership with two other medical practitioners, paying a premium of £460, he has now withdrawn from the firm retaining the branch which he started, and received £144 in twelve monthly instalments in settlement from his former partners He asks whether these instalments are taxable

*** It appears to us that the £144 is a capital receipt, as the £460 was a capital payment, and as such is not liable to income tax

Fees for Part time Work

"W L C" inquires whether fees received for part time work for the Ministry of Pensions can properly be averaged in with general practice earnings for Schedule D assessment The local inspector of taxes claims to assess the fees separately under Schedule D

*** The question of separate assessment of fees chargeable under Schedule D (for example hospital retainer fees) was a frequent source of trouble in pre war years, but it was understood that the Board of Inland Revenue had definitely accepted the suggestion that they might reasonably be included in the Schedule D assessment The fees referred to by "W L C" are relatively a good deal larger in amount, but, on the other hand, are more closely allied to general practice earnings, inasmuch as they are paid on what is approximately a *quantum meruit* and not on a salary basis, and we know of no reason why the ordinary procedure should not be followed in assessing them The matter, unfortunately, is one of administration rather than of law and we suggest that "W L C" might give formal notice of appeal to the inspector against the assessment but should, before taking subsequent steps to test the technical merits of the assessment place the whole of the facts before the Board of Inland Revenue—addressing his letter to the Secretary, Somerset House, W C 2—and await its decision

Anticipatory Deduction

"J E H S" states that on a recent claim to repayment in respect of the year 1923-24 the inspector of taxes proposes to make a deduction for tax which will be payable by him for 1924-25 under Schedule A

*** The proposition should be resisted It is, no doubt convenient to set off from an amount repayable to a taxpayer any sums then due from him, but it is quite unreasonable and not justifiable in law, to set off tax which has not become legally due to the Revenue

LETTERS, NOTES ETC

A MEMORIAL WINDOW

DR J FLETCHER HORNE (The Poplars, Barnsley) writes To complete a sketch of a painted window to the memory of a physician I am desirous of finding a suitable subject for the central light of a three light window The figure should be standing and looking to the right in order to be in agreement with an adjoining window St Luke has been proposed as most suitable, but I have been unable to find a satisfactory print Possibly some reader of the JOURNAL may be kind enough to refer me to a fitting subject for the purpose

THREADWORMS

DR RACHEL GETHEN (Stanford le Hope, Essex) writes in reply to "J E W" (August 30th, p 391) In January, 1923, an adult aged 44 years, was treated by me for recurrent attacks of thread worms She had suffered in this way for ten or fifteen years, and everything known had been tried Remembering the good effect of thymol in ankylostoma duodenale, I prescribed two successive nightly doses of 30 gr each in an alcoholic solution, observing the usual dietetic restrictions and purgatives, hoping the anthelmintic effect would be as good in the appendix as in the duodenum The result was everything to be desired at the time No further treatment was requisite and I heard from her to day 'There has been no recurrence whatever since, thanks to your treatment"

TREATMENT OF ALOPECIA

DR CLYDE MCKENZIE (Smethwick) writes, in reply to "Medico's" request (September 27th, p 603) for suggestions in treating a severe case of alopecia areata I have obtained successful results with ultra violet light, using quartz applicators and an atmospheric quartz mercury vapour lamp as supplied by Kelvin, Bottomley and Baird A few applications, beginning with three minute radiations, are usually successful

"A H M D" writes In answer to "Medico," I have had great success by giving parathyroid tablets 1/20 grain daily Further, a personal experience is this I have been taking arsenic since February for pernicious anaemia, my long standing bald pate has now a fair growth of hair

HERPES AND VARICELLA

DR R LESLIE DAGGER (Morpeth) writes I was interested in Dr Frederick MacSorley's note (September 27th, p 604) pointing out the relationship between herpes zoster and varicella, and would like to mention two recent cases which came under my care and which presented the converse of the case he quoted Two adults of different families, each having a child contracted herpes zoster At the time I was treating them I warned each party that, in all probability, their child would develop chicken pox in about a fortnight In each case much to the amazement and wonder of their respective parents the child did so Are we justified, nevertheless, in all cases of herpes and varicella to prognosticate the development of varicella, on the one hand, and of herpes on the other, in some of the more immediate "contacts" with these cases?

THE CONTINENTAL HORSE TRAFFIC

THE majority of the horses exported from this country to the Continent are intended for almost immediate slaughter for food, a paper by Mr R G Linton, of the department of hygiene of the Edinburgh Veterinary College, gives some particulars of general interest about the trade Prior to 1914 regulations were very slack From then until 1921 the Ministry of Agriculture demanded a certificate that the animals were fit for work In the spring of 1921, however, the whole regulations were revised, a high standard of fitness was demanded, and these conditions were stringently observed There is now no traffic in decrepit or worn out horses The standard demanded for those animals shipped abroad is higher than that required for the horses still at work on the streets of this country Since 1921 horses unfit for work have been slaughtered in this country, and the trade in horse carcasses has steadily increased Most of them go to Belgium, France, and Holland, and while the numbers of horses and carcasses respectively exported to these countries in 1920 were 58,000 and 15,900, these figures are now almost reversed All carcasses are inspected by a veterinary inspector either before shipping or after arrival—in some cases on both occasions, depending on the regulations of the importing country The horse carcass trade is now as much under control as the dealing with any other form of animal food, and a very high standard of cleanliness is, as a rule, observed Mr Linton, after stating that some very fine animals are sent over for slaughter, observes—"rather a pity when one considers that many miserable animals that have long since earned their rest are allowed to work on our streets by those societies that seem to have taken over the responsibility of the administration of the Protection of Animals Acts" The details given show that there is now no grounds for complaint of cruelty or mismanagement Mr Linton maintains that any alteration of the present system by which only horses certified by the veterinary inspector as "fit to work" are exported would be inadvisable

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 38, 39, 42, and 43 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 40 and 41

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 132

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

242. Quinine in Lobar Pneumonia

L NICOLAYSEN (*Tidsskrift f den Norske Lægeforening* June 15th 1924, p 549) has given intramuscular injections of quinine since July, 1919, to the patients suffering from pneumonia in his hospital, which is Department VIII of the Communal Hospital in Christiania At two other medical departments (VII and IX) which are conducted by other doctors, injections of quinine are not given for pneumonia These two departments, therefore, served as controls, and the comparison was the more fair as all three departments admitted the same class of patient under the same conditions, with the exception of the quinine treatment The period studied was from January 1st, 1920 to April 1st, 1923 In this period Departments VII and IX treated 254 cases of pneumonia, 58 of which terminated fatally the mortality being 22 8 per cent In the same period Department VIII treated 93 cases 13 of which terminated fatally the mortality being 13 per cent To make the comparison more fair the author withdrew from the statistics of both groups all those patients who died within twenty four hours of admission to hospital and who could not, therefore, have had reasonable time in which to benefit from any treatment The corrected figures thus obtained showed a mortality rate of 17 3 per cent for Departments VII and IX, and only 9 4 per cent for Department VIII When the patients were classified according as their ages were below or above 50 it was found that the older patients did not seem to benefit greatly from the quinine the mortality in the quinine class being 25 per cent and in the non quinine class 28 per cent But below the age of 50 the mortality was only 4 2 per cent for the quinine class, as compared with 13 9 for the non quinine controls The composition of the solution injected was according to Aufrecht's prescription Quin sulph 0 50 gram, urethane 0 25 gram, aq dest 5 c cm This solution can be sterilized by boiling and if a little of the quinine in this concentrated solution becomes precipitated it is only necessary to warm the solution slightly before injecting it, and the precipitate will again be dissolved The author gives the injection into the muscles of the buttocks or thighs, and only occasionally has he seen persistent infiltration or slight necrosis ensue The first injection is given immediately after admission to hospital, the second is given on the following day the injections being repeated on alternate days, but not more than a total of four being given, as a rule in each case The author supplements this treatment with camphor which he gives by the mouth or by subcutaneous injection

243. Ambulant Treatment of Gastric and Duodenal Ulcer

I BOAS (*Deut med Woch*, June 13th 1924 p 783) has been driven by economic stress to give his patients ambulant treatment instead of strict rest in bed for gastric or duodenal ulcer While ambulant treatment should not be attempted for acute ulceration associated with severe haemorrhage, practically as good results were obtained in less acute stages of gastric and duodenal ulcer by ambulant treatment as by complete immobilization in bed for several weeks But if ambulant treatment is to be successful the patient must follow a strict dietary For the first week he should live only on slops, including milk, cream, and soups, more attention being paid to resting the stomach than to giving the normal number of calories After the first week, if all goes well the slops may be supplemented by soaked rusks and white bread in the third week by mashed potatoes and stewed fruit or gruel made with flour and in the fourth week by pulped vegetables eggs, soft cheese, and bread and butter In most cases, before each meal, sodium bicarbonate magnesia, and extract of hyoscyamus is given The author insists that this ambulant treatment should be controlled by examinations of the stools once or twice a week for occult blood the persistent absence of which is a very reliable sign of healing of an ulcer

244 Glycerin Lymph and Lanoline Lymph

S CUNNINGHAM and J A CRUICKSHANK (*Indian Journ Med Research* 1924, p 1173) as the result of an investigation at the King Institute of Preventive Medicine Guindy, Madras, of over 1 280 000 vaccinations, of which 1 181 715 were performed with lanoline and 105,437 with untreated glycerin lymph came to the following conclusions (1) Untreated glycerin lymph is superior to lanoline lymph for vaccination purposes under tropical conditions similar to those found in the Madras Presidency (2) When the conditions as to vaccination and verification are carefully controlled untreated glycerin lymph has been found to give an average take success rate of 90 9 and 88 9 per cent (3) Under similar conditions the average take success rate and insertion success rate obtained with lanoline lymph have been found to be 70 1 and 79 1 per cent respectively (4) Vaccine vesicles produced with glycerin lymph are larger and in every way more typical than those produced with lanoline lymph (5) For the ten day period during which the keeping properties of the two types of vaccine were tested the glycerin lymph gave the better results

245 Typhus Parotitis

W M WERZBLOWSKI (*Deut med Woch*, 1924, I, p 276) states that apart from mumps typhus fever is the only infectious disease in which non suppurative parotitis occurs as is shown by the following figures During the period 1903–17 when he was in charge of the department of infectious diseases in a Government hospital in Russia, among 9 731 cases of various infectious diseases simple parotitis occurred only in typhus Among 1 620 cases of typhus there were 48 complicated by parotitis, which was simple in 20 and suppurative in 28 Diphtheria, measles, and scarlet fever showed no tendency to give rise to parotitis at all Among 333 cases of small pox there were 8 cases of parotitis which were all suppurative and occurred only in the severest forms of the disease, of which they represented a pyaemic metastasis Among 251 cases of typhoid there were 11 cases of parotitis, which all ended in suppuration owing to a mixed infection from the mouth In cholera, dysentery and relapsing fever parotitis was always a late complication and always ended in suppuration During the period 1917–22, when Werzblowsky was in charge of a military hospital, out of 2 000 cases of typhus 252 developed parotitis, which was simple in 93 and suppurative in 159 Typhus parotitis presents the following characters In most cases it is unilateral Of 113 cases of simple parotitis it was bilateral in 22, and of 187 cases of suppurative parotitis only 7 were bilateral In one instance the parotitis was simple on one side and suppurative on the other The earliest date for the appearance of simple parotitis in typhus was the sixth day and the latest two days after the temperature had become normal In most cases the complication appeared between the eighth and eleventh days of disease, and lasted a fortnight the shortest duration being eight days and the longest three or four weeks According to Werzblowsky, the occurrence of suppurative parotitis in typhus has not the evil significance which it has in other infectious diseases

246. Syphilis and Tuberculosis.

A NADEL (*Derm Woch*, July 12th, 1924, p 61) observes that the most difficult task in the treatment of syphilis is to devise effective treatment in resistant cases Irreparable functional injury or disfigurement may result from the failure of ordinary treatment Resistance may be due either (1) to the system becoming accustomed to arsenic or (2) to the spirochaetes becoming arsenic proof In other cases failure of treatment may be due to the presence of another infection One of the most important of these is tuberculosis Nadel describes a case of gummatous ulcerat on of the face in an old tuberculous subject A butcher's assistant aged 2–, whose parents had died of tuberculosis (nine of his fifteen sisters also were dead), contracted syphilis in 1919 He had had several courses of mercuric salicylate and neosalvarsan He developed extensive ulceration around the left inner canthus and a large ulcer over the left malar bone and was pale and emaciated The Wassermann reaction was strongly positive The ulcers were septic with undermined edges on which were telangiectases He was given bismuth intramuscularly and intravenous injections of neosalvarsan with fifty inunctions of mercury ointment and the ulcers were treated with boric lotion and hydrogen peroxide Three months later the ulcer on had extended greatly, and there was some necrosis of the nasal lacrymal and frontal bones A skiagram of the chest showed extensive tuberculous lesions A mixed vaccine (streptococci and staphylococci) was given, in addition to a course of salvarsan and mercury, with daily doses of potassium iodide but the patient became worse A large abscess appeared in the left parotid region, but the left temporo-maxillary joint escaped invasion The pus contained *B. proteus* and *Staphylococcus aureus* no tubercle bacilli or spirochaetes were found No improvement followed the evacuation of the abscess The ulcers were then swabbed

with an aqueous solution of neosalvarsan This produced rapid improvement, but was so painful that Lugol's iodine solution was substituted Iodoform glycerin was injected into the abscess cavity, which was also treated by quartz lamp irradiations A year later the ulcers had healed but some cicatricial ectropion of the lower lid remained The patient had transient albuminuria whenever mercury was administered, but nephritis did not supervene, his general condition is now satisfactory

Surgery.

247 Oesophageal Pouches

B ANGLESIO (*Archiv Ital di Chirurgia*, July, 1924, p 469) publishes six cases of oesophageal pouching, with radiograms, full details of the operations, and subsequent histories About 270 cases have been recorded to date, and most of them were in the upper part of the pharyngo oesophageal tract Males are more often affected than females, and symptoms are rare before the age of 40 Some cases may be congenital or due to inherent weakness of that part of the oesophagus, but in the great majority of cases the chief causative factor is intrinsic or extrinsic stenosis of the first part of the oesophagus This stenosis may be traumatic inflammatory, or due to the pressure of a new growth The pouch is usually single, but double pouches have been described, the size varies, the commonest site is the posterior wall of the oesophagus, and the pouch tends to grow to the left The symptoms are those of stricture, and differ from those due to a carcinoma by their long duration and mode of onset Soft food can often be taken when liquids are rejected Unless the pouch is very big there are generally no external signs, and in diagnosis one has to rely on sounding and radiography The author recommends, where possible, resection of the pouch at one sitting, in some cases of malnutrition a preliminary gastrostomy may be necessary Invagination of the pouch involves a tedious convalescence Of the six cases reported three were operated on with very successful results, one died of pneumonia before operation, another refused operation, and the last had a tumour pressing on the oesophagus, the diverticulum being found at the autopsy The author gives a bibliography of some seventy references to recent literature on the subject

248 Operation for Cancer of the Sigmoid

C H MAYO and W WALTERS (*Surg., Gynecol and Obstet.*, July, 1924, p 1) give a description of the two stage Mikulicz operation for removing cancer of the sigmoid and descending colon End to end or lateral anastomosis gives excellent results in selected cases where the patient is in good condition If a primary operation is performed a tube should be passed from the anus to extend ten or twelve inches above the anastomosis, this prevents hardened masses of faeces from exerting pressure on the suture line and obviates gas distension The operation consists in drawing the affected segment of bowel out of the abdomen after separating the mesentery and suturing the two limbs together, attaching it to the abdominal incision with the diseased part projecting beyond the skin After waiting for adhesions to form the obstruction may be relieved by a small opening in the distended loop, and in four to eight days the entire projecting area is cut away, leaving the two ends of the colon flush with the skin Two weeks later crushing forceps are applied to the apposed walls of the intestine and gradually tightened, this re establishes communication, and the fistula will either close itself or can be readily closed later by a secondary extraperitoneal operation Statistics show that of 152 cases with cancer of the sigmoid and recto sigmoid 52 are living and well after a number of years, whilst an additional 37 had from two to seven years of post operative life In several cases there were loops of bowel adherent to the growth and requiring simultaneous resection In some cases the uterus and ovaries had also to be removed on account of involvement Where the growth is low in the sigmoid the rectum can be loosened up to the levator ani and brought up to the skin The two stage operation gives a lower mortality than other methods and offers a better chance of complete cure

249 Xanthosarcoma

B J C DEN HARTOG (*Nederl Tijdschr v Geneesk.*, June 7th, 1924, p 2566), of the Pathological Laboratory of the University of Amsterdam who records two cases, states that xanthosarcoma, of which no example has previously been published in Holland, is characterized microscopically by (1) hyaline tissue rich in cells, (2) giant cells, (3) pigment, (4) xanthoma cells, (5) vessels On naked eye examination the hyaline connective tissue presents a shiny greyish white appearance, of firm consistence, and the xanthoma cells give the growth an opaque yellow or greyish yellow colour and soft or pseudo-fluctuating consistence, when there is much pigment present the colour of the tumour is brownish black In almost all cases there is a formation of nodules which may be so marked as to make the growth resemble a blackberry, mulberry, or bunch of grapes The following two characteristic features are in favour of xanthosarcoma being a tumour rather than an infective granuloma In the first place, it can be readily shelled out from the surrounding tissue Even after several years' duration its separation can be effected without difficulty In the case of a granuloma, on the other hand, there are always adhesions to the surrounding tissue Secondly, xanthosarcoma not infrequently shows a local malignancy—for instance, the skeleton, joint capsules, or tendon sheaths may be invaded The development of xanthosarcoma is often attributed to trauma, which Rosenthal noted in 18 3 per cent of 71 cases In 50 cases collected by Den Hartog trauma occurred in 9, in two of which it was due to the patient's occupation, 5 of the 50 cases had recurrences In 31 cases the tumour was situated on the arm and hand (in 16 on the right side, in 9 on the left, and in 6 the side was not stated), in 14 it was situated on the feet (in 7 on the right foot, in 4 on the left, and in 3 the side was not stated), and in 5 cases the site was not given When the limbs are affected metastases do not occur, so that this form of tumour is relatively benign The skin is very rarely attacked The first of Den Hartog's cases occurred in a man aged 31, in whom the growth appeared on the left middle finger after a fall The swelling grew very slowly, and was excised after two years' duration, when it was found to present the typical appearances of xanthosarcoma The second case occurred in a man aged 35, in whom the growth was situated on the back of the foot, without any history of trauma Complete recovery took place after its removal

250 Pulsating Exophthalmos

C E LOCKE, JR (*Annals of Surgery*, July, 1924, p 1) points out that 588 cases of pulsating exophthalmos have been described since 1809, 23 per cent of these were spontaneous, whilst 77 per cent were traumatic in origin In some cases where an autopsy was obtained there was a communication between the internal carotid artery and the cavernous sinus, in others there was an aneurysm of the internal carotid or ophthalmic arteries Of the traumatic cases 94 per cent had an arterio venous communication between the internal carotid and cavernous sinus The condition is easily recognized clinically, yet it may be difficult to decide whether it is due to aneurysm or arterio venous communication In elderly people aneurysms are more liable to occur, whereas traumatic cases are nearly always cases of arterio venous communication A pulsating swelling above the inner canthus is usually seen with the arterio venous type, and the exophthalmos is greater The treatment includes various procedures to prevent the direct short circuiting of arterial blood into the venous system Three different principles have been applied (1) production of obstruction in the afferent arteries by compression or tying, (2) obstruction to arterial blood in the veins by tying or compression of the superior ophthalmic vein, (3) promotion of clotting in both arteries and veins by rest and subcutaneous injections The author recommends prolonged carotid compression before tying the carotid artery

251 Unger's Operation for Pituitary Tumours

E UNGER (*Zentralbl f Chir.*, July 19th, 1924, p 1560) observes that recent advances in clinical diagnosis of pituitary and other tumours in the region of the sella turcica have necessitated investigation of the best method of exposing this region He performed the following operation A woman, aged 39, had a pituitary tumour or cyst Under local anaesthesia an incision was made down to the frontal bone three fifths of an inch above and parallel with the supraciliary ridges this was carried backwards on each side parallel with the zygoma, the temporal fascia and muscle on each side being divided An osteoplastic flap was then raised, the frontal, parietal, and temporal bones being cut through from the supraciliary region to each temporal fossa, and then upwards to the vertex, a square of bone being thus raised, its attachment to the aponeurosis and hairy scalp was preserved The dura mater was then incised along the edges of the bony division The falx was divided between ligatures placed on the superior and inferior longitudinal sinuses A brain retractor was now introduced into the anterior fossa and the frontal lobes were raised, the head being held in a dependent position The pituitary region was exposed clearly, and a bluish glistening cyst was seen The right optic nerve was very swollen, but the left nerve appeared to have escaped After evacuation of 10 c cm fluid the cyst wall was partially excised, when a good view was obtained of the optic nerves and tracts, the chiasma, and the whole region of the sella turcica The wound was closed

and healed by first intention In three weeks there was obvious improvement in vision, walking and headache, this was maintained for three months when the pressure symptoms gradually returned before death occurred

Diseases of Children.

252. Post-encephalitic Behaviour Disturbance

B I BEVERLY and M SHERMAN (*Amer Journ Dis Child*, June, 1924, p 560) record two cases both of which were referred by the Juvenile Court In the first case a boy of 11 there was a vague history of an illness during which he slept for most of a month and from which dated the behaviour disturbance The boy appeared apathetic he admitted his delinquencies, but could give no reason for them The neurological examination was negative and the mental age was 8½ (Stanford Binet) Six months later the psychiatric condition was unaltered but neurologically he presented typical signs of the post encephalitic Parkinsonian syndrome The second case, a boy of 15 gave no history of any illness and was normal until September, 1920, when he was referred for treatment on account of indecent exposures and incorrigibility at school On examination his mental age was 11½ his behaviour seemed childish for this age he was emotionally shallow and showed poor insight The only neurological physical signs were sluggish slightly unequal and irregular pupils and the Wassermann test was negative Two years later his behaviour showed no change, but his mental age was 15 he had adequate intelligence and neurologically he was a typical case of post encephalitic syndrome The authors remark on the fairly constant symptomatology of this condition There may be a history of influenza diplopia, strabismus or protracted somnolence, from which mental changes may date or they may develop at any time up to several years afterwards Personality changes occur with a definite time of onset, and the most outstanding characteristic is mental deterioration with a high mental rating by intelligence tests The changes commonly are outbursts of temper irresponsibility incorrigibility, childish mannerisms cruelty to animals and children, lying, and stealing

253 Post operative Retention of Urine in Children.

H BOENINGHAUS (*Zentralbl f Chir* June 28th, 1924 p 1406) who records a case in a boy aged 7 states that transient retention of urine is frequent in adults after operations especially on the pelvic organs in women and that ischuria lasting for several days is no uncommon being explained by a temporary disturbance of the innervation of the bladder The younger the patient the less frequent the retention Some authorities indeed, maintain that it never occurs under the age of 15 Boeninghaus's patient while under medical treatment for tuberculous peritonitis suddenly developed pain in the left groin and swelling and redness of the correspond ing site of the scrotum As the spermatic cord was much thickened and very tender the possibility of its torsion was considered, and an operation was performed, when it was found that there was an extension of the peritoneal tuber culosis to the vaginal process, which was removed The wound healed rapidly, but retention of urine lasted for four days and was only cured by induction of ethyl chloride anaesthesia, which had to be employed on three days in succession Seven days after his discharge the boy was readmitted for erysipelas starting from the operation wound Complete retention again occurred, and was successfully treated by ethyl chloride anaesthesia as on the previous occasions

254 Treatment of Whooping-cough

K KASSOWITZ (*Wien med Woch* May 17th 1924 p 1022) describes the following therapeutical experiment which illus trates the inefficacy of the various methods recommended for the treatment of whooping cough Twins aged 8 months were admitted to hospital with severe pertussis on the sixteenth day after the beginning of the cough and on about the fourth day of the paroxysmal stage The number of attacks during the first two days was fifty five and fifty seven in one and fifty six and fifty five in the other The children were then put in separate rooms so as to eliminate the action of suggestion and one twin was given no drugs at all while the other was subjected to the following treatment (1) Sodium bromide 3 grams per diem combined with luminal 0 1 gram per diem for four days The number of attacks was reduced by about half, while only a moderate diminution occurred in the control child Somnolence, however and diffuse bronchitis with a slight rise of temperature ensued so that the treatment had to be discontinued (2) Injections of 1 c cm ether on two consecutive days, but without the slightest effect (3) Quinine hydrochloride 0 2 gram per diem had without any influence on the number and intensity of the attacks (4) Parenteral protein therapy in the form of intra muscular injection of 3 c cm skim milk A distinct febrile reaction ensued, but no improvement resulted (5) Antipyrin 0 2 gram per diem was then given for three days also without obvious effect The number of attacks had now fallen to 30 twenty daily but in the untreated child they were consider ably less (6) 0 01 gram of codeine hydrochloride was given without even transient improvement On discharge from hospital at their mother's request after seventeen days stay both twins still had about ten attacks daily, the violence and duration of each attack being about the same as on admission The untreated child, however, showed a distinct advantage over his brother both as regards the number and the intensity of the attacks

Obstetrics and Gynaecology.

255 Pernicious Anaemia and Childbirth

K VON OETTINGEN (*Zentralbl f Gynäk*, Jul, 12th 1924 p 1506) points out that pregnancy will occasionally bring on a form of pernicious anaemia, differing from the disease usually described under that name which is a constitutional disease progressing with intermissions to a fatal termination The anaemia of childbirth attacks healthy women who recover when the aggravating cause—namely, the pregnancy—is removed or complete d It is, however secondary in type as indeed is any anaemia of toxic origin since the damage to the blood forming organs as well as to the blood cells is secondary The author quotes the case of a woman previously healthy, who in each of three pregnancies suffered from hyperemesis accompanied by severe anaemia lemon colouring of the skin c c The labours were uncomplicated but were all followed by fever of unknown origin The anaemias became progressively worse during each succeeding preg nancy, although during the intervals between them the patient returned to her normal state of health At the end of the third puerperium she was put under treatment by arsenic and blood transfusion and improved considerably

256. Mikulicz's Drain after Wide Hysterectomy

J L FAURE (*La Gynécologie* July 1924 p 403) in a com munication to the Société de Chirurgie de Paris, stated that since 1920 he has inserted a Mikulicz drain in the pelvis after doing Wertheim's operation for cancer of the cervix the mortality has been reduced from 11 per cent previously to under 4 per cent in seventy six operations He inserts on the pelvic floor a bag containing five or six gauze compresses and a gauze drain four or five metres long The compresses are removed on the second day and the drain on the fourth the bag is taken out on the ninth or tenth day If a vaginal drain has been used it is removed on the fourth day Faure is convinced that his improved results are due to reverting to the Mikulicz drain which was wrongly abandoned about 1900 in consequence of improvements in the technique of peri tonization He lays stress also on the importance of the operator standing on the patient's left side and on the use of a large retractor such as Doyen's

257 Spontaneous Rupture of Uterine Veins during Labour

C TENCONI (*Annali di Ostetricia e Ginecologia* July 31st 1924, p 316) describes one case and discusses five from the literature, in which rupture of uterine veins during labour led to fatal intraperitoneal haemorrhage In all these cases as in three cases of rupture of the solemn vein towards term the bleeding was so gradual in the early stages as to prevent diagnosis Pain apart from that of the uterine contractions was not reported for several hours there was increasing abdominal distension and tenderness The two chief conditions to be considered in differential diagnosis are rupture of the uterus and premature detachment of the normally situated placenta (accidental haemorrhage) In none of the cases of ruptured veins did the uterine contractions cease to occur regularly the reverse is the case with uterine rupture The absence of external bleeding is against the diagnosis either of ruptured uterus or of accidental haemorrhage (in the majority of cases) and the latter condition is associated with alterations in the shape and consistence of the uterus In Tenconi's cases unlike the others variance were present in the region of the external genitalia. It is suggested that in a patient suffering during labour from abdominal distension and tenderness with some increase in the pulse rate and dullness in the flanks paracentesis abdominis should be performed and that if blood is drawn off the abdomen should at once be opened.

258 Puerperal Thromboses

G SCHAANNING (*Norsk Mag f Laegevidenskaben*, July, 1924, p 505) has studied the incidence of clinically demonstrable thromboses of the lower limbs among the 9,367 maternity cases admitted to a hospital in Christiania in the six year period 1917-22 There were fifty seven such cases, or 0 61 per cent of the total The average period between confinement and the onset of symptoms of thrombosis was from fifteen to sixteen days, the shortest being three days and the longest fifty one days In most cases the thrombosis began between the eleventh and the eighteenth days of the puerperium It follows that those maternity hospitals which discharge their patients on the seventh to the ninth day must keep their records of thromboses low at the cost of the patient, the author points out that his hospital's comparatively high thrombosis record is due to the fact that, even in uncomplicated cases, primiparae are not allowed to get up till the twelfth day of the puerperium, and are not discharged till the fourteenth day, multiparae being allowed to get up and to leave the hospital a day earlier than the primiparae None of the fifty seven patients died of embolism, but there were two deaths from pyaemia and one from pneumonia, in thirteen cases embolism occurred without fatal consequences It was found that thrombosis was comparatively frequent among women whose confinements had been protracted and attended with excessive loss of blood In the case of women who had lost more than 1,000 c cm of blood during the confinement, the incidence of thromboses was 2 92 per cent, whereas for those who had lost less than 1,000 c cm it was only 0 44 per cent There seemed to be no association with the age of the patient and the number of previous confinements, and no definite relationship was established between the incidence of thromboses and of puerperal fever or mastitis

Pathology.

259 Neurotropism in Spirochaete Strains

J H SCHULTZ (*Deut med Woch*, July 4th, 1924, p 914) gives an account of a small epidemic of syphilis which confirms the experimental work of Plaut and others who have taught that the affinity of various strains of spirochaetes for the nervous system differs greatly While on manœuvres in 1908 four officers contracted syphilis from the same woman One of them came of neuropathic stock, but the others belonged to perfectly healthy families Although all four were given skilled specific treatment, all developed severe neuro syphilis Four years after infection the officer who came of neuropathic stock developed hemiplegia when he was 27 years old Though vigorous treatment was given the hemiplegia remained practically stationary, and the patient developed irritability, slight dementia, and lack of staying power The second patient developed tabes of moderate severity, and the last two died of general paralysis, the rapid progress of which could not be checked even by intralumbar injections of specific remedies The fate of the woman who had infected these patients was not ascertained

260 Local Immunity to the Staphylococcus and the Streptococcus

IN this article A BESREDKA (*Ann de l'Inst Pasteur*, July, 1924, p 565) gives a summary of his work during the past two years on local immunity to staphylococci and streptococci If 1 c cm of a twenty four hour broth culture of a staphylococcus be injected beneath the skin of the abdomen of a guinea pig it gives rise, after a slight delay, to a rapidly spreading oedema, the skin becomes infiltrated, turns black, and finally sloughs off, leaving a large wound, which takes a long time to heal A quite different picture is seen in guinea pigs which have received the day before a compress, applied to the shaven skin, of a heated broth culture of the staphylococcus In this case there is little more than a superficial lesion, or more often a circumscribed abscess, which soon heals Arguing that there must be some substance in the broth culture which exerted an action antagonistic to that of the staphylococcus, he began working with older cultures, and found that by filtering an eight or ten day broth culture of staphylococci he was able to obtain a body which was atoxic, thermostable, and specific, this substance he calls an "antivirus" Injected intraperitoneally, it affords no protection, but if given intradermally—or, still better, as a sheet dressing applied to the skin—it gives rise to a marked immunity to a subsequent injection of a lethal dose of the staphylococcus The immunity thus obtained is independent of the presence of antibodies, and is of a strictly local nature Passing on to the consideration of the streptococcus, he records experiments in which, by applying a dressing soaked in a ten day filtrate of a broth culture of the streptococcus to the shaven skin, he was able to protect guinea pigs against a dose of living streptococci fatal to the control animals in twenty four hours Other animals which were treated by a dressing soaked in serum broth alone died in the same time as the controls The streptococcal antivirus, like that of the staphylococcus, has a distinct affinity for the skin, injected intraperitoneally, it exerts no protective effect From these animal experiments he passed to the treatment of human patients suffering from various lesions due to the staphylococcus or streptococcus, and by making use of his principle of the creation of a local immunity by applying a dressing soaked in a filtered culture of the infecting organism to the invaded part he was able to secure some striking therapeutic results Cases are recorded of osteomyelitis, puerperal infection, dacryocystitis, and rhino pharyngitis—among others—in which a cure of astonishing rapidity was produced, even when the lesions were chronic and had withstood all other methods of treatment

261 Tubercle Bacilli in the Lymphatic Glands of Healthy Children

DURING the course of two years ELISABETH PROSPERT (*C R Soc de Biologie*, July 25th, 1924, p 542) has made 100 necropsies at children's hospitals, and has systematically removed the mesenteric and the tracheo bronchial glands with the object of discovering how many patients harboured living tubercle bacilli in these structures The technique of the examination consisted in reducing the glands to pulp, treating them with 4 per cent caustic soda for three to six hours, and then planting them on to Petroff's medium From 85 cases which were completely free from tuberculous lesions, she succeeded in isolating tubercle bacilli from the mesenteric glands six times, in three of these cases the cultures from the tracheo bronchial glands were likewise positive In 15 of the patients there were tuberculous lesions present—in the meninges, lungs, or glands of these ten had mesenteric glands which appeared healthy, yet in every case the tubercle bacillus was recovered In the remaining five cases the mesenteric glands were caseous These results agree with those of previous workers She considers that they support the hypothesis that in man, and in animals susceptible to tuberculosis, infection in the vast majority of cases is primarily of a lymphatic nature, originating in the absorption of tubercle bacilli from the alimentary tract

262 Flagellar Agglutinins

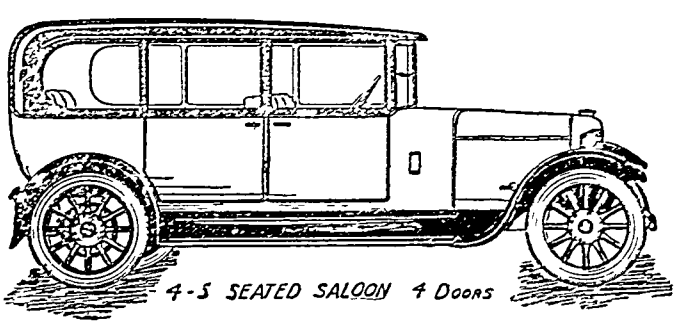
MARION L ORCUTT (*Journ Exp Med*, July, 1924, p 43), working with the bacillus of hog cholera, noticed a difference in the motility of the organisms from separate colonies, and succeeded in obtaining pure cultures of a motile and of a non motile form A serum was prepared against each of these types The motile type serum agglutinated the motile culture in the form of soft, loose clumps in a dilution of 1 in 20,480, whereas it agglutinated the non motile culture in the form of small, fine clumps to a titre of only 1 in 640 On the other hand, the non motile type serum agglutinated both cultures to the same titre Absorption experiments showed that the motile type absorbed all agglutinins for both cultures from both serums, while the non motile type absorbed only agglutinins for itself from the motile type serum and all agglutinins from its own serum As it appeared probable that the flagella were able to give rise to specific agglutinins, an attempt was made to prepare a serum against them alone For this purpose a forty eight hour agar culture was suspended in saline and shaken with glass beads for half an hour, and then centrifuged for one to two hours By this means the flagella were broken off from the bacteria, which were then carried to the bottom, leaving the flagella in the supernatant fluid This fluid was drawn off, shaken, and centrifuged *again* The upper half of the fluid was drawn off and plated on agar to determine its freedom from bacilli Microscopical examination showed the presence of masses of flagella, but no bacteria Those supernatant fluids which were sterile were heated for half an hour at 60°-62° C, and were then used for the preparation of an immune rabbit serum Agglutination tests made with this serum showed that the motile bacilli were brought down in a dilution of 1 in 5,120, whereas the non motile bacilli were completely unaffected Absorption of this serum with the non motile type did not alter its titre When the serum was put up against the flagella suspension a soft, delicate, rather fluffy precipitate was observed up to a dilution of 1 in 320 By filtering the flagella suspension this was demonstrated to be a true agglutination reaction, and not the result of precipitins, no reaction occurred with the filtrate The experiments have shown that it is possible, starting from one culture, to prepare three serums—namely, against the original motile type, the non motile type derived from it, and the separated flagella This direct production of a flagella antiserum indicates that the flagella contain a separate specific antigen

The old fashioned mattress says—Be different—Remain ill—Result Ill health Restlessness and bad sleep

Staples is the most luxurious mattress made—the deep springs mould themselves to the figure—cradling it softly yet supporting every portion equally—even muscle relaxes automatically—the nerves are auto-suggestively soothed sleep is induced

BY APPOINTMENT
Messrs STAPLES & Co Ltd have the honour to announce that they have been appointed Wire Mattress and Bedsteads Manufacturers to H.M. THE KING

Staples flatter cannot stagnate—Ensure clean wholesome—Result—Perfect health nerves soothed by deep



It is impossible for a Staples Mattress to sag—It is commended by ALL Doctors—Ideal well-ventilated Doctors sleep on a Staples flatter therefore in healthier homes than on any other form of mattress—verb sap

HORMOTONE
for
PREMATURE SENILITY
and
OLD AGE

Stimulates metabolism
Increases muscle tonicity
Raises respiratory exchange
Effects marked subjective improvement

"Old age being caused by degeneration of the endocrine glands, especially the thyroid and sexual glands, all that is necessary to secure rejuvenation is to improve the condition of these glands The best and easiest way to do this is to administer by the mouth extracts of these glands, after their extirpation from healthy animals . .

"The persons treated looked considerably younger after it, to the extent of ten or fifteen years and sometimes even more The wrinkles in the face already began to disappear four or five weeks after the treatment, and at the same time, previously corpulent persons, losing their excess of fat, were made to look slender, thus imparting a youthful impression"

(Lorand, "Life Shortening Habits and Rejuvenation," 1922)

Dose 1 or 2 tablets three times daily

PRACTICAL MIDWIFERY.

By **GIBBON FITZGIBBON** M.D., Master Rotunda Hospital Dublin.

A book from the Master of the Rotunda Hospital [illegible] particularly [illegible]—BRITISH MEDICAL JOURNAL

London J & A. CHURCHILL, 7, Great Marlborough Street, W 1

Vol. I (1924) of the Extra Pharmacopœia

By MARTINDALE & WESTCOTT,

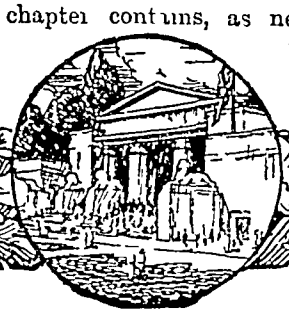
is now ready, **27/6** *net*, *post free*, **28/-**

The book embodies the results of a vast amount of research in **Chemistry, Pharmacology,** and the closely **allied sciences**

It is claimed that **no modern Medicinal Chemical, Drug, Organotherapeutic agent** or **Vaccine,** worthy of inclusion, has been **omitted** The **handy little volume,** containing 1,163 *plus* xxxviii pages, should find a place in every Consulting Room, Pharmacy, and Laboratory, as a reference book in matters appertaining to the therapeutic use of drugs and chemicals

Not only is the medical and chemical literature, one might say almost of the world, summarised concisely, up to within a week or two of publication, but the data are given concerning **practical laboratory work** and **experimental trials** of **new therapeutic agents** not to be found in other treatises

It is only possible to give an outline of some of the new information



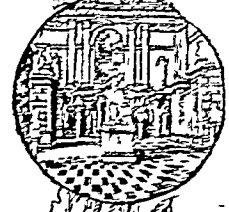
NEW CHEMICALS, DRUGS, AND METHODS OF TREATMENT.

ALKALOIDAL NOTES This chapter contains some interesting observations regarding **"Activated" Alkaloids** and, in addition, the description of a series of **Alkaloidal Periodides** The preparations may, in both cases, be useful additions to the physician's armamentarium

ASPIRIN COMPOUNDS, include therapeutic notes upon various new halogen derivatives

BISMUTH, ORGANIC COMPOUNDS The "pros and cons" of these competitors of mercurials, and their chemistry, are described in six pages

COLLOIDAL METALS. The chapter contains, as new, **Colloidal Calcium, Colloidal Lead,** also notes upon the **Collodial Gold** treatment of neurasthenia, alcoholism, and the morphine habit



EMETINE & ITS COMPOUNDS —Fifteen pages are now devoted to these Emetine Periodide and a variety of supplementary remedies for use in amœbic dysentery are described

ACCESSORY FOOD FACTORS —The information under this heading runs to ten pages, clearly subdivided under the sections 'Factors' A, 'B, and C Practical hints are given for making preparations of each, to retain the factors unimpaired by heat, oxidation, etc

CHAULMOOGRA COMPOUNDS —New suggestions for injections for use in leprosy, etc, including compounds of the Ethyl Ester type

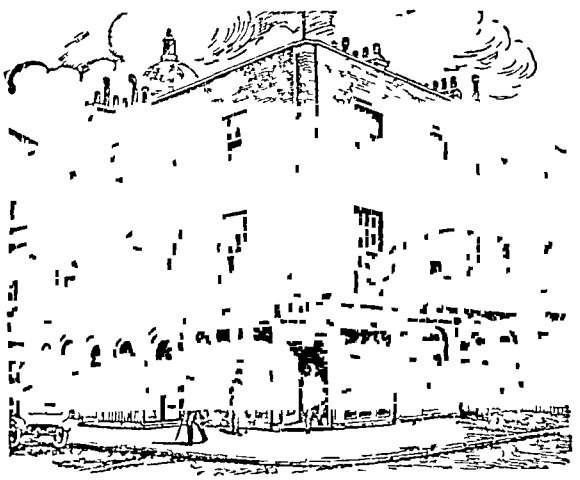
INSULIN —The subject of diabetic treatment with this is discussed in eight pages, under such headings as Manufacture, Units, Technique of Injection,

Suitability of Case, Contraindications Effects of Excessive Dose, Clinical Experience, and so on

NON-IONISABLE MERCURIALS (Mercurochrome, Flumerin, and allied bodies) are fully dealt with

QUINIDINE AND CINCHONIDINE in malaria as also in heart affections, are concisely commented upon

VACCINES AND ANTITOXINS —The matter on these now runs to seventy-five pages It has been completely overhauled and rendered up to date New Tuberculins call for mention



ORGANOTHERAPY —Thirty pages are devoted to Endocrinology and treatment with animal products in general In particular attention may be drawn to the chapters on Pituitary, Thyroid, Parathyroid, and Suprarenal.

INTRAVENOUS DOSE TABLE —A useful guide to this method of medication, which offers such great possibilities in the future

DANGEROUS DRUGS ACTS —A concise summary including Calculation Tables, carefully enunciated directions for the medical man and pharmacist Examples of Procedure by actual prescriptions, "Signed Orders," and the like A New Sign is introduced showing every 'dangerous" drug throughout the book

The work is, in effect, of unique value to the prescriber and the chemist

EPILEPSY

Doctors in Hospitals, Infirmaries, and other Institutions and General Practitioners all over the country are prescribing—

AMBRIODIN

with excellent results in cases where other treatment has failed. It quickly reduces the attacks without the undesirable effects which invariably accompany the administration of potassium Bromide. The patient's general health is not impaired but distinctly improved.

A DOCTOR WRITES — Patient was a man of 60 who for 40 years was subject to fits which as years advanced became more frequent. When called to treat him the fits were occurring weekly and were of a typical and severe type which usually incapacitated him for 24 hours. I began the Ambriodin treatment and very soon benefit was noted in that the period of length of fit was shorter and less severe, the intervals between were prolonged till periods of three months intervened and then only assumed more of the petit mal form. He was so convinced of their efficacy that he would not be without them. (*i.e.* Ambriodin Tablets)

For recent Medical References see —*The Lancet Sept. 6th 1924 page 498. The Prescriber June 1924. The Journal of Clinical Research April 1924.*

AMBRIODIN IS NOT ADVERTISED TO THE PUBLIC

DOES

The "Curtis" Abdominal Support

CREATE A CONDITION OF MUSCULAR INNERVATION AND RESULTANT ATROPHY?

This question is frequently asked, and the following extract from "CHRONIC INTESTINAL STASIS" (A Radiological Study) by Dr A C JORDAN, provides a convincing reply, e g

"Some think that the belt compresses the muscles and interferes with their circulation and innervation This is not so The belt merely displaces the muscles backward and supports the abdominal wall"—Page 177

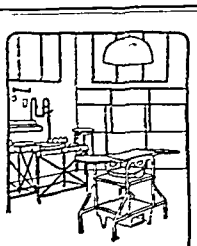
Important Announcement to whom it may concern

CHARLES H. BABER,

The Pioneer of Heel-to-Ball Fitting,



has severed his connection with Babers Ltd (Jersey) Oxford Street where he acted as Managing Director from the inception of the Co and has now opened at 304-6 Regent Street (opposite The Polytechnic) Doctors may rely upon his personal service for any clients they may send with foot trouble

Mr Baber wishes to take this opportunity to thank the medical profession for their support in recommending the new method of foot fitting which has been so beneficial to the public Mr Baber wishes it to be understood that he does not cure anything but simply fits the foot as nature intended

P S—Bespoke Dept now added Surgical instructions carried out in full detail In connection with this an improved X Ray machine has been installed

Calcium Therapy in Phthisis

Kalzana—the new chemical combination of calcium and sodium lactate—quickly controls Hæmoptysis and Night Sweats It regenerates the weakened cells, encourages the formation of new connective tissue, and increases the resistance to the infection. By virtue of its sodium lactate constituent, Kalzana raises the alkalinity of the blood to the degree necessary to secure adequate calcium retention.

Kalzana
The Lime Food

A WULFING PRODUCT

At all Chemists, in bottles containing 75 tablets at 3/6 each.

Samples and full medical literature sent upon application to Therapeutic Products Ltd. (late J G Clark) Napier House, 24/27 High Holborn, W C 1

The Evidence

(Extracts from the Medical Press).

Night Sweats

"Even in the case of a patient suffering from phthisis in extreme cases with high fever the sweats ceased the very first night and there was no recurrence.

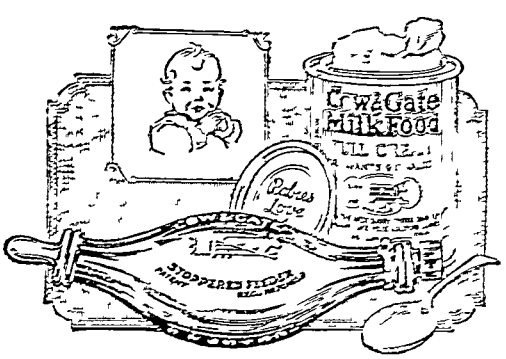
I have not heard any complaints regarding unpleasant laxative effects or disagreeable taste. Children too or all ages took Kalzana tablets without hesitation and without presenting secondary symptoms."

Haemoptysis

The success we have had in treating Hæmoptysis by the administration of calcium in this efficacious form (Kalzana) enables us to recommend its use strongly in such cases.

Kalzana evokes no injurious secondary effects such as gastric disturbances irritation of the kidneys &c. even when administered in large doses for long periods"

Full paper sent upon request



WHEN a mother has to resort to foster feeding for her baby, with the choice of a suitable food comes the selection of an efficient Feeding Bottle

The invention of the new **COW AND GATE FEEDER** marks finality in Feeding Bottles

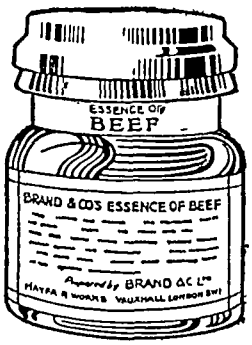
Many and varied have been the attempts to devise a bottle which allows a sufficient but not excessive supply of Food

Remembering how easy it has been previously for baby to get too much food or not enough, this has been a most difficult task, but at last we've got it, and, like most wonderful inventions, the idea is simplicity itself

An octagonal glass stopper, secured by a movable rustless clip at the opposite end to the teat, has a small zigzag groove which, when turned, makes the flow of food quicker or slower, to suit the sucking power of the infant

Other features are clear markings for table spoons and ounces a flat base teat end out of contact with food when bottle is placed flat, entire absence of crevices, patent teat having thin ribs inside—one needs to be tightly rolled between fingers to completely dislodge any secretion of food which may exist No child can remove either teat or stopper, leakage is impossible

It forms the IDEAL BOTTLE for the IDEAL FOOD



Cow & Gate

ESSENCE OF BEEF.

Recognised by Medical Men for nearly a Century as a **marvellous stomachic**, without an equal in the treatment of cases of **Gastric Trouble, Fevers, Impaired Digestion, Nervous Prostration,** and similar diseases.

MEAT JUICE.

Described by "THE LANCET" as **"a powerful, nourishing and stimulating fluid"** Rich in uncoagulated proteid, extractives and salts derived from the fresh muscle juices of the finest British Beef

BRITISH MADE and prepared at the Dietetic Laboratories of

BRAND & CO. Ltd., Mayfair Works, Vauxhall, LONDON, S.W. 8.

ASPRIODINE (Registered Trade Mark)

CHEMICAL COMPOSITION —Aspriodine is a definite compound, containing **41 47** per cent **Iodine** and **58 53** per cent **Aspirin** It is preferably given as such in tablet (crushed) or in cachet form with water

PHARMACOLOGY AND THERAPEUTIC USES —Aspriodine embodies the properties of Aspirin and Iodides It is not affected by physiological acid, but it is readily split up by the alkalinity of the digestive tract Small continued doses should prove of decided value in rheumatic affections, in arterio sclerosis, in asthma, and in many other conditions where Iodides have proved beneficial

DOSE —5 grains per diem after food may be regarded as efficient The dosage may if desired, be carefully increased

PRICE Tablets, 5 gr Bottles of 25, 2/6, 100, 7/6 Cachets, 5 gr , 24, 3/

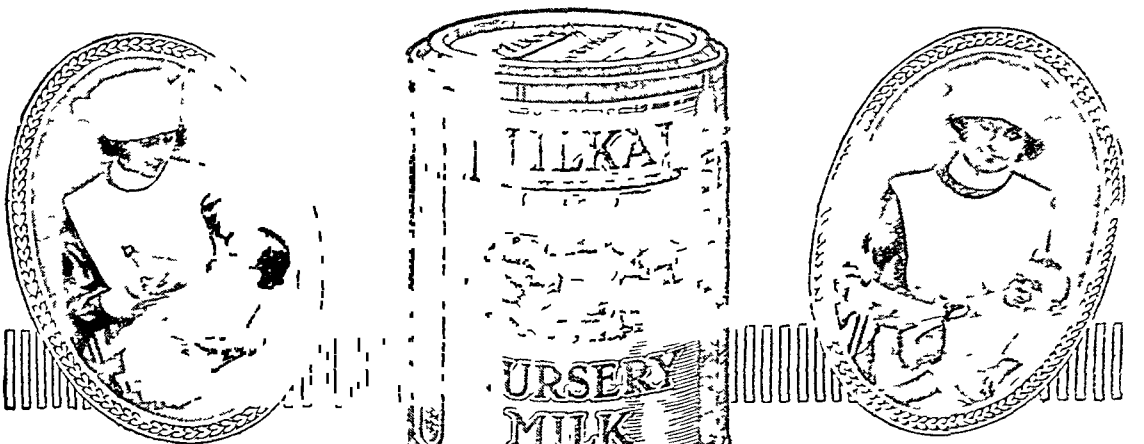
CRISTOLAX

PALLAS ATHENÆ.

"Cristolax is a new, improved and entirely satisfactory method of administrating liquid paraffin, eliminating the disadvantages of the uncombined oil, and adding to the efficacy of the treatment. It ensures natural and easy movement of the bowels and lubricates the whole digestive tract, enabling it to recover its normal tone, and thus obviating the disturbing after effects which follow the use of ordinary aperients

Cristolax contains 50 per cent liquid paraffin and 50 per cent. Wander Malt Extract and is presented in the form of granular crystals Extremely pleasant to taste it mixes freely with milk or water without separation of the oil. The highly nutritive digestive and milk modifying properties of the Wander Malt Extract are retained unimpaired thus making the preparation a valuable addition to infant feeds



It mixes thoroughly with the intestinal content preventing formation of Scybala, and does not cause over lubrication. When added to cow's milk Cristolax prevents the formation of indigestible curds and supplies the deficiency of carbohydrate. It can be administered to infants in the usual bottle feeds.

Cristolax" is in daily use in many Infant Welfare Centres and Hospitals

A liberal supply for Clinical trial will be gladly sent on receipt of request

Trufood is practically identical in composition with breast milk

Humanised Trufood marks the greatest advance of recent years in the artificial feeding of infants Containing nothing but the solids of pure milk, it corresponds very closely to human milk when reconstituted with water The following graphic comparison of the composition of Human ised Trufood with that of breast milk on the one hand and cows milk on the other brings out very clearly the advantage over ordinary dried milk.

	Breast Milk	*Cow's Milk*	*Humanised Trufood*
Lactose	6 5	4 7	6 25
Fat	3 3	3 5	3 45
Casein	0 9	3 0	0 80
Lactalbumen	0 4	0 3	0 60
Salts	0 2	0 8	0 65
Water	88 7	87 7	88 25
	100 0	100 0	100 0

No other baby food corresponds more closely to Nature

The resemblance to breast milk is even closer than is revealed by the above data, since both enzymes and vitamins are present as in human milk This is owing to the fact that in the Trufood process the optimum temperature reached is 145°F, whereas the dried milks offered as baby foods are in most cases heated up to 220/240°F with resultant loss of enzyme and vitamin contents

You are invited to apply for reproduction of actual photograph (in colours) of a recent incubation test of various milks This is obtainable either by post or at the TRUFOOD STAND (Nos 1223 and 13 13) at the London Medical Exhibition

Samples adequate for full clinical trial, together with descriptive literature, will be sent post free

Hemochromatosis (rectal section)

LUBRICATION THERAPEUSIS
IN GASTRO-INTESTINAL ULCERATIONS.

A NOTED gastroenterologist points out that the first and last few feet of the gastro intestinal tract are the regions where ulcerations most commonly occur Ulcers of the esophagus, stomach, and duodenum, are fairly common, he states, but those of the jejunum and ilium are exceedingly rare Ulcerations in the upper digestive tract are practically never multiple, while those occurring in the lower bowel are usually multiple In fact, routine proctoscopic examinations by one of the leading gastro enterologists have shown that ulcerations of the large bowel are much more common than heretofore supposed

As you know, laxatives and purgatives given in gastro intestinal ulceration cases are often the cause of the chronicity of this condition or of hæmorrhage, and perforation, and are therefore contraindicated Naturally a high residue diet is also contra indicated

Hence, Nujol the lubricant *par excellence*, is best adapted to corrective *intestinal drainage* in these cases Whether the ulcers are in the esophagus, stomach, duodenum, or colon, its action is protective, coating the ulcers and favouring healing Nujol furthermore produces its effect *without peristalic unrest* Injected directly into the colon, as an enema, Nujol has a very noteworthy effect in healing the ulcerations

Nujol, the ideal lubricant, is the therapeutic *common denominator* of all types of constipation Microscopic examinations show that too high a viscosity fails to permeate hardened scybala Too low a viscosity tends to produce seepage Exhaustive clinical tests show the viscosity of Nujol to be physiologically correct and in accord with the opinion of leading medical authorities

Roboleine

Justifies its recommendation because its worth has been amply proved by medical men for the past 18 years

To the practitioner who seeks a reconstructive of the very highest quality, it is sufficient to state the formula of 'Roboleine' · at once it will be seen that here is a correctly balanced food of the highest nutritive qualities

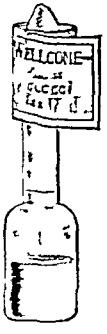
THE FORMULA IS:

MARROW
from the long bones of prime oxen.

RED MARROW
from the rib bones of prime oxen.

CREAM OF MALT
(Described by *The Lancet* as the "crème de la crème of malt extracts")
Egg Yolk, Neutralized Lemon Juice.

In slow convalescence due to weakened digestive functions, 'Roboleine' is especially valuable, for it is assimilated with ease when other foods are rejected.



Clinical Sample and Literature on request.

PICTOGRAPHS AND IDEOGRAMS EVOLVED BY CHINESE PIONEERS OF A SYSTEM OF WRITING.—Writing in China, as elsewhere began its career in archaic pictorial characters. It remained in the pictographic stage later in China by about 2000 years than in the countries which had a contemporary civilisation—it is interesting to find that the beautiful Chinese script is still pictographic in form though much disguised There were three principal stages in its evolution. In the first we see the rude forms of objects A number of these are here reproduced each with its present-day equivalent beside it. But these simple pictographs could not represent abstract ideas and the first change came when some pioneer thought of blending them to make ideograms By combining the pictures for sun and moon the idea of light, brightness was produced. Morning was indicated by a picture of the sun causing dew to fall. A line passed through the pictogram for rings made the word for threading By repeating the sign for 'tree' the word for forest resulted while three such signs one above and two below formed the ideogram for shady dense. A heart with two horizontal lines (the number 2) above it, expressing the idea of feeling the sorrows of another heart, signified a compassionate being Some of these ideograms with their modern equivalent words are here illustrated The third stage was the addition of ideograms of phonetic characters by which their meaning could be modified. By this process words could be coined in any number

OPENING PAPER

BY

Sir ROBERT JONES, K B E, C B, F R C S,
Consulting Surgeon Royal Southern Hospital Liverpool Director of Orthopaedics, St Thomas's Hospital London

Hallux valgus is a deformity of the first metatarso-phalangeal joint where the great toe is deflected outwards, or, in other words, adducted towards the centre of the foot There may or may not be disability as a consequence, and if there is it does not necessarily depend on the degree of adduction If the adduction is extreme the second and, sometimes, the third toes are either over- or under lapped, or in certain cases may only be deflected outwards A bursal enlargement over the dorsal and inner side of the head of the metatarsal occurs in a considerable proportion of cases where the lateral angulation is extreme Even the presence of the bursa may give rise to scarcely any discomfort

Pronounced hallux valgus, therefore, like many types of flat-foot, may exist merely as a harmless deformity, and need not, save for æsthetic reasons, come under the notice of the surgeon Furthermore, the feet of the majority of adults would not conform to the normal standard which insists that the phalanges should be in a line with the metatarsal bones In the early stages of the deformity the toe can be easily placed in correct alignment later the deformity is fixed and cannot be overcome by manipulation The deformity usually develops after the age of 25, but should it occur during the athletic stage a complaint is sometimes heard that efficiency is lessened I was consulted by a famous sprinter with a left-sided valgus and he told me that he had been obliged to start his sprinting with his right foot as his left big toe had weakened He had no other disability By correcting the deformity and restoring the alignment of the extensor proprius hallucis he was enabled to renew his practice of starting his races with the left foot forward Several instances have been brought to my notice where the deflected toe appreciably weakened the fore part of the foot This is to be expected when we reflect upon the part played by the big toe in walking and in running This toe has a responsibility surpassing that of all the others in what I presume we all agree is the correct method of walking—namely, the alternate heel and toe—and in running it requires to be abducted to ensure its strongest grip Except in the case of the athlete who requires every atom of power, these points will not arise—the adducted toe will generally suffice

When the surgeon is consulted he is faced with the problems of pain and discomfort and only occasionally does a patient come to him solely because of the deformity There have been endless theories as to the etiology of the deformity, and I will not trouble you as to whether the ligaments or the muscular system or the joints are at fault, but I prefer to emphasize my belief that in the vast majority of cases the demands of fashion are to blame It is a question of boots—they are the exciting cause—ligaments and muscles and joints are merely their victims The deformity is a postural one in the first instance, an organic one later It is an outcome of our so-called civilization which demands that our feet should be moulded to a covering which has no reference either to the shape or the size of the foot All investigations have borne out the statement that primitive races exhibit well developed and normal toes I need only allude to the Abyssinians, certain South African races, and the American Indian All these races practise a heel-and toe walk and can abduct their big toe They walk with parallel feet, some of them pigeon toed, and although the longitudinal arch is often flattened they do not exhibit the everted foot It the toes are pointed forwards eversion cannot take place for the foot becomes a lever of propulsion, the muscles and joints being constantly exerted The rolling everted foot is no longer a lever, and the muscles of the sole and calf are proportionately attenuated

The studies of Hoffman who investigated the feet of barefooted Philippine and Central African races, bear out the conclusions of other observers In the primitive foot as in the shoeless child the movements resemble those of hands, and the great toe can be abducted almost as a thumb Furthermore the metatarso-cuneiform joint allows of very considerable movement, suggestive of the metacarpal of the thumb We have all seen the extraordinary development of the functional activity of the toes found in armless humans A child at Bachurch Hospital afflicted by infantile paralysis of the arms learnt to perform practically every action which could be done by the hands and the parents were very loath that she should undergo any treatment for the arms which might hinder the functional development of the toes It was found by Hoffman that the widest part of the undistorted foot corresponded to a line drawn from the top of the fifth toe transversely across the foot In a conventional shoe this, as we know, is anything but the case The phalanges in an undistorted foot should be in a line with their several metatarsals, and when weight is borne the toes separate and widen the base of support The great toe, to be at its greatest functional efficiency, should be apart from its neighbour by a wide interval It thus forms a support which assists in adducting the foot I have been at pains to dwell on this etiological factor as there is a tendency to overemphasize exceptional cases where the deformity could not be ascribed to the boot, and to instances where atrocious boots have not given rise to pain and disability I have never seen a normal foot in women who have worn fashionable boots although many have escaped pain and disability which, as we know only affect comparatively few

What are the causes of pain and disability? Generally the formation of a bursa or bunion, which becomes painful when inflamed This bursa does not always develop in the same spot When the deformity is but moderate it may be situated more on the dorsal aspect of the joint, when extreme it is found almost wholly on the inner side of the joint At this stage the head of the first metatarsal has undergone certain changes The cartilage which is unopposed, is thinned, and if arthritis is present may present erosions and lipping similar to that found in osteo-arthritis Osteophytic deposits may be felt beneath the bursa and a subluxation of the phalanx is present The flexors and extensors of the toe-joint are displaced outwards and are important agents in adducting the toe The sesamoids are often found to one or other side of their normal position The internal lateral ligament is very much stretched and is generally thickened The bursa which may be multilocular, sometimes communicates with the joint The external lateral ligament is short and thick, and frequently an irregular thickening is found at the inner side of the base of the first phalanx The sesamoids sometimes show inflammatory change and pressure erosion Corns may develop on the skin covering the bursa The bursa sometimes perforates and a sinus may persist if suppuration occurs, and in rare cases this may be connected with the joint

A hammer-toe is frequently associated with hallux valgus and is usually caused by it We rarely meet a pronounced case unless it is accompanied by a flattening of the longitudinal and transverse arches

The symptoms of hallux valgus as the pathology suggests, may be very trivial or extremely severe They may be due to inflammation of the bursa, periostitis around the edges of the capsule, traumatic arthritis either simple or of the osteo-arthritic type, osteophytic pressure on the digital nerves—all these often complicated by the presence of

adhesions In a small proportion of cases callosities may form under the head of the first metatarsal bone, and these are largely the result of the flattening of the transverse arch, while corns and callosities may be found over the second and third toes The symptoms, therefore, may be ascribed to strain and pressure

Hallux rigidus is allied in its etiology and pathology to hallux valgus It is, however, more frequently associated with an injury, and we find it often in the footballer who has passed his prime It is a progressive lesion, and in the later stages may present very marked arthritic changes with enlargement of the metatarsal head In elderly subjects the condition cannot be distinguished from osteo-arthritis Here again we have flattening of the arches, but callosities under the metatarsal head are not so common Bursae may form on the dorsal aspect of the head, but they are comparatively rare

The symptoms complained of in the early stages are those of a simple sprain developing into chronic arthritis The only objective sign is that of deficient dorsiflexion Attempts to straighten the toe give pain In the later stages the toe is fixed in plantar flexion, and walking becomes a very painful act, relieved sometimes by dorsiflexion of the terminal phalanx The fixation of the toe-joint is first a protective spasm, but later the joint and periarticular structures show signs of chronic inflammatory changes which prevent motion

When pain is associated with hallux valgus it is due to (*a*) an inflamed bursa, (*b*) arthritis, as in hallux rigidus, (*c*) osteophytic pressure on the digital nerves, (*d*) callosities under the joint

TREATMENT

Surgeons are apt to display unjustifiable optimism when they discuss the results of treatment In my opinion we should be extremely careful as to prognosis Results in every type of case are sometimes brilliant—but not always Care should be taken to find out precisely the chief disability of which the patient complains Is it the bunion, or the callosity under the toe, an arthritis, or the irritation of osteophytes? May not the discomfort arise from the adjoining hammer-toe, from metatarsalgia, or from flattened arches? The surgeon should know definitely whether the operation he proposes to perform will meet not merely one but every indication There is no apparition more unpleasant and accusing than the lady who declares that her foot is worse than it was before the surgeon intervened If she complains of pain and desires to be eased, and operation has failed to make her comfortable, it is of no avail to try and persuade her to be contented with a reconstructed and artistic joint She asked for comfort, and she failed to get it

The treatment of hallux valgus may be considered under three heads in relation to pain and disability (*a*) preventive, (*b*) mechanical, (*c*) operative

Preventive Treatment

If the deformity is in its postural stage our object will be to prevent further adduction of the toe, and correct any accompanying flattening of the arches We are rarely consulted at this stage, and then only for aesthetic reasons, for usually there is neither pain nor disability We should treat the flat-foot in accordance with principles which we individually cherish and see that the footgear does not encourage the deflection of the toe Correct shoes or boots should be insisted upon Perhaps I may be excused if I again emphasize the essentials of a correct boot It should fit moderately closely around the heel and ankle to prevent hitting of the heel in the boot The inner side of the boot should be straight right up to the tip of the big toe Any outward deflection favours the production of hallux valgus The sole of the boot inside should be as broad as the foot under the strain of body weight The upper part of the boot should not compress the forefoot The toecap should be sufficiently roomy to allow the free play of the toes, and should be higher on the inner than on the outer border It must be long enough to allow the foot to extend to its full length Stubbing of the great toe is an exciting cause of hallux rigidus

If these points are laid before the patient who suffers only from deformity but has no pain, she will be quite unhappy, and will ask, "Can nothing be done to my toe which will render such footgear unnecessary?" My answer has always been, "If I operate on your toe, and you wear your favourite shoes, then the deformity will return" I confess to being very averse to operating upon hallux valgus for aesthetic reasons unless I am given a free hand as to after-treatment It is an unscientific proceeding and ends in worry Removal of the head of the metatarsal is too radical, shaving the metatarsal head does not correct the deformity The effective operation is to take a wedge from the neck of the metatarsal quite close to the head, but in twelve months the deformity will have returned unless the fashionable boot is discarded Many years ago I used to make an incision on the inner side of the foot, subcutaneously divide the tight structures on the outer side of the joint, and excise and reef the capsule on the inner side The toe looked perfect after the operation, but the end-results were entirely in the hands of the patient, and were therefore usually unsatisfactory The same may be said of transposition of the extensor proprius hallucis to the inner side of the base of the first phalanx My experience of these and many other methods leads me to the conclusion that it is inexpedient to operate on the toe-joint for the correction of deformity, where function is good, unless an appropriate after-care is assured

Mechanical Treatment

This should consist in relieving the joint from pressure The sole of the boot should be thick enough to prevent strain on the toe in walking, and a bar of leather should be placed transversely across it just behind the metatarso phalangeal range The upper part of the boot should not press upon the inner side of the joint but be moulded out on a last, or the joint may be protected by the application of a horseshoe-shaped pad of adhesive felt with the base above I have lost all confidence in toe-posts or external splinting They are uncomfortable and ineffective If a callosity is present below the joint the boot may be hollowed there, but if this is done it is advisable to place within the boot a thick felt sole reaching from the heel to a point just behind the metatarso-phalangeal range The heel of the boot should be made higher on the inner than on the outer side in order to deflect the body weight from the great toe, and also to correct the flat-foot If arthritis is not a feature gentle manipulation prevents the formation of adhesions, and the patient should practise active movements, preferably in hot water, every night and morning

If the bursa is inflamed absolute rest should be prescribed, and if great pain is present ease is often secured by the application of fomentations If the bursa suppurates the abscess should be opened

One knows only too well that these conservative methods have their limitations, but it should not be forgotten that markedly pronounced hallux valgus is often painless, and it is only when an inflamed bunion supervenes that treatment becomes necessary Once the bursa recovers pain disappears, and this is frequently brought about without operative intervention I have known many instances of this sort where the experience of a painful bursa has overcome a patient's objection to an appropriate boot, the wearing of which has resulted in prolonged immunity from recurrence

Operative Treatment

We should mention, in order to condemn, certain procedures which are being practised We not uncommonly find suppurating joints due entirely to the fact that the surgeon has attempted a reconstructive operation during the inflammatory stage of the bursa This condition is very apt to occur, and it is essential to allow an interval of a few weeks to pass between the recovery of the bursa and the operative attack Cases also are found when both hallux valgus and hallux rigidus are treated by excision of the joints It is liable to result in a painful ankylosis for which it is difficult to find a remedy This operation should never be performed

Another useless operation is that of excision of the bursa without reference to the roughened bony prominence of the metatarsal head Equally futile is a transplantation

of the extensor proprius hallucis either into the metatarsal head or to the base of the first phalanx

The aims of operation should be the correction of deformity, the restoration of movement and, when possible, the preservation of the weight-bearing portion of the head

There are four types of operation which may be considered

(*a*) The removal of the bony prominence on the inner side of the foot together with the bursa
(*b*) Osteotomy of the neck of the metatarsal
(*c*) Removal of a part or the whole of the head of the metatarsal
(*d*) Removal of the base of the first phalanx

Before performing any of these operations I endeavour to find out where the pain is most severe Is it over the inflamed bursa, or confined to the joint? Is it referable to the callosities or to the space between the first and second metatarso phalangeal joints? Is the pain induced when the toes are pressed together If pain is confined to the region of the bursa and there is no evidence of an arthritis of the joint, I am content to remove the lateral prominence of the metatarsal together with the bursa, divide the extensor proprius hallucis, which helps to maintain the deformity, and to divide the capsule and shortened structures on the outer side If the valgoid deformity is not too pronounced and displacement can be rectified without much force, I pass a deep suture through the structures on the inner side of the neck of the metatarsal and the base of the first phalanx, which acts as an internal splint when tightened This operation generally succeeds in affording relief and in minimizing deformity

Removal of the head of the metatarsal I reserve for extreme cases of hallux valgus associated with bunion where the head is rough and painful and the joint tender It is an operation more suited to the elderly than to the young and athletic, and should never be performed if relief can be obtained by less drastic methods A patient who is in great and fairly constant pain will be well satisfied by the result of this operation, even if his foot remains weaker because of the loss of support It is prudent to warn the patient who submits to the excision of the head that his foot may be less effective as a support than the sound one, and that in a certain proportion of cases the metatarso-phalangeal range may give trouble and form a plantar prominence As a rule the operation is a distinct success and enables a patient to carry on painlessly even if his habits involve strenuous exercise of the feet

Where osteo-arthritic and periarthritic changes are present and the toe presents a large and gouty looking prominence it may be necessary to remove about half an inch of the neck If this is not done a firm, fibrous, but painful ankylosis is likely to occur I have several times experienced this in middle aged people In the athletic, when the head has to be removed and where the support of the arch is very necessary, an endeavour should be made to leave as much bone below as is possible The tightened structures on the shortened side should be severed and extension applied to the toe in such cases The danger lies in too close an approximation of the phalanx to the metatarsal, with resultant pain and stiffness This may be avoided by keeping the surfaces well apart until the wounds are healed and then encouraging active and passive movements There is no need to describe this operation It should be in the nature of a pseudarthrosis with the intervention of a flap, the tightened structures on the outer side should be released, and the extensor proprius hallucis should be divided There is no object in fixing the tendon into the base of the phalanx as it would tend to approximate bones which we desire to keep apart I need not dwell upon the great importance of making the section of bone clean and workmanlike Any spicules of bone left give rise to trouble

Where hallux valgus is accompanied by plantar callosities excision of the head should be the operation of choice Contrary to the general view, I am disinclined to remove the sesamoids unless there is a clear indication They form a very excellent buffer between the skin and bone and when the head of the metatarsal is removed they recover from pressure irritation A splint keeping the toe well abducted should be employed during the healing of the wound Occasionally one meets with a prominent osteophyte on the inner and lower part of the neck of the metatarsal in an otherwise painless hallux valgus Pain of an acute type is felt on pressure from above and below between the first and second metatarsals It is the same kind of pain experienced in metatarsalgia, and is, I believe due to the same cause In metatarsalgia the pain may be acute for a week or a fortnight, and then remain in abeyance until something occurs to make the nerve again hypersensitive Relief is obtained by chiselling away the osteophyte It is very rarely necessary to remove the head of the bone

Removal of the base of the first phalanx first of all suggested by Davie-Colley, and several years later by Steele and Keller, has, in my opinion a distinct place in the surgery of hallux valgus and rigidus It is indicated in the young and athletic where deformity is of no great importance, and where the maintenance of the strength of the forefoot is paramount It is especially useful in those cases where pain is limited to the joint, and where the bone surrounding the head is smooth and painless It is not suited for those cases where pain is located at the under or outer side just below the head The operation is very simple An incision about two inches in length is made on the inner side of the joint which is exposed The articular ends are separated and about a third or more of the first phalanx is removed If a bursa is present it can be removed together with the bony prominence This operation has the great merit of relieving the arthritis, while it does not intertere with the integrity of the transverse arch

Hammer-toe is so often associated with hallux valgus that it demands consideration Often the condition is a crippling one only because of a painful corn It is useless to excise the corn and a tragedy to amputate the toe We have all been asked to amputate the toe and I hope we have always refused to do so When the toe has been amputated in the absence of hallux valgus the operation has been the direct cause of the deformity The most effective treatment is division of the dorsiflexor and removal of the corn and ankylosis of the joint Division of the capsule and forcible rectification are quite inadequate

Hallux rigidus is a chronic irritative arthritis in which deformity plays but little part Pain and disability are due to plantar flexion and every attempt to rise upon the toe strains the joint Callosities under the toe are comparatively rare, but lipping in the later stages is frequent and may be found both on the upper portion of the metatarsal head and the first phalanx It is even in its early stages complicated by adhesions

The operative treatment of hallux rigidus is to aim at securing mobility without friction Whenever possible the head of the bone should be preserved and the operation of choice should be the removal of the base of the first phalanx Much relief may follow manipulation in the early stages of this affection

SUMMARY

Both hallux valgus and hallux rigidus are closely associated with flattened arches A flattened arch aids in the production of a hallux valgus by altering the line of pull of the extensor proprius hallucis, and a hallux rigidus aids the flattening of the arches because the foot is deprived of the free propulsive action of the big toe

The leverage action of the foot as propulsive agent is most effective in a toe-and heel walk with the feet parallel and the big toe slightly abducted

The etiological factor which is mainly responsible for the weakened arch and adduction of the big toe is the modern boot This is proved by an examination of races who wear no boots and whose feet conform in flexibility and appearance to those of a child before its feet are cramped Both the infant and muscular adult native can freely abduct the big toe

The preventive treatment of hallux valgus con[illegible] in

developing a heel-and-toe walk with parallel feet, and in wearing anatomically correct shoes

The mechanical treatment consists in deflecting the body weight from the inner to the outer side of the foot and in relieving the painful joint from pressure and friction

Operations for the correction of deformity in cases which present no functional debility should not be undertaken lightly, and never unless the patient is prepared to wear appropriate boots

The choice of operation should be decided by the special circumstances of the case For mild cases of hallux valgus without symptoms when the deformity can easily be rectified without force, it is sufficient to divide the capsule and reef it to the inner side, divide the extensor proprius hallucis, and remove a flap of skin so that when the edges are approximated it will hold the toe in slight abduction

Where there is neither pain nor disability, but where the deformity is more extreme and cannot be rectified by manipulation, it may be necessary to expose the joint, divide the tightened structures on the outer side, divide the extensor proprius hallucis, and perform a cuneiform osteotomy on the inner side

Where the symptoms are entirely referable to the bursa and do not involve the joint, the bursa should be excised together with the bony prominence below

A removal of the whole of the metatarsal head with part of the neck should be reserved for those of middle life where osteo-arthritic and periarthritic changes have occurred, the joint looking large and gouty Unless bone is fully removed in such a case pain and stiffness will remain

Removal of the head of the metatarsal should be reserved for those extreme cases associated with bunion where the head is rough and painful and the joint tender It is more suited to the post-athletic age

When dealing with the young athlete—even in extreme cases—special endeavour should be made to retain as much of the metatarsal as possible in order to maintain the strength of the arch The incision through bone should be oblique, and a portion of the lower surface of the head left The structures which hold the bones together should be divided, the bursa and its bony bed should be removed The toe should be maintained well extended until the wound has healed

In cases of hallux valgus where the symptoms seem to be maintained by friction of the first phalanx with the metatarsal, excision of the base of the first phalanx may be sufficient The arch is thus maintained

Where symptoms resemble metatarsalgia and pain is referred to the space between the first and second metatarsal heads, an osteophyte is often found attached to the neck on its under surface This requires removal

In hallux rigidus the operation of choice is that of the removal of the base of the first phalanx, care being taken to remove sufficient bone

After each type of operation treatment should be directed to prevent recurrence, and the musculature of the foot should be developed

The disadvantages of all operations where deformity is excessive and its reduction is effective lies in the fact that the big toe remains too wide apart from the remaining toes, and no boots can be bought to fit the foot This is due to the increased separation of the first metatarsal from the second To obviate this deformity I would advise an osteotomy just distal to the *base* of the first metatarsal, and so approximate the first metatarsal to the second This will materially lessen the deformity Reidl recommended a wedge osteotomy (with the base inwards) of the internal cuneiform bone, but this is not so effective as a division of the metatarsal Young of Philadelphia in an interesting investigation, found that in an appreciable number of cases of hallux valgus a wedge-shaped supernumerary bone is found between the internal cuneiform and the base of the metatarsal He looks upon this as an etiological factor, and by removing it and keeping the foot in equino-varus the deformity is corrected This bone is similar to the intermetatarseum described by Dwight The correction can only take place by the approximation of the heads of the first and second metatarsals If the abducted toe cannot be easily restored by manipulation further operative measures will be needed

GENERAL DISCUSSION

The President (Mr R C Elmslie) considered that cramping of the fore part of the foot and the abolition of muscular activity was more important than side pressure It was necessary, therefore, to re-educate the muscles by massage, etc, and to secure abduction of the great toe Before any routine operation was performed it was important that the main symptom should be seriously considered He laid stress on the following operative points (1) trimming of the exostoses round the head of the metatarsal, (2) excision of the head generally, but preserving the cartilaginous bearing surface on the under side if possible, (3) the rubbing of Horsley's wax into the raw bone, (4) keeping the transverse arch strapped for two months subsequently Massage and re-education of the rest of the foot followed

Mr D McCrae Aitken (London) said that the manner in which Sir Robert Jones had opened the subject for discussion had been so generous in its breadth of treatment of the many factors associated with the production of hallux valgus that ample openings for further discussion were made Few, however, would be able to add much to what he had said from the patient's point of view about the practical benefit to be derived from treatment, whether operative or non-operative From a survey of nearly half a century of practical experience, Sir Robert could speak in a way which left his hearers indebted to him, for he had not been silent about the disappointments, and had always considered the practical service to the patient first of all He was particularly grateful to the opener for introducing hallux rigidus into the discussion, for he considered hallux rigidus and hallux valgus to be closely related in nature and in etiology, both were intimately associated with, or even directly dependent on, flat foot, to which reference had been made Pronounced *hallux valgus* was perhaps more common in women, who, as a sex, were more addicted to the use of pointed shoes than men, hallux rigidus without much valgus deformity was probably more common in men The boot factor might therefore help in determining the type of deformity He thought it would be generally conceded that flattening of both the longitudinal and transverse arches was invariably present in adult patients with hallux rigidus or valgus The point he proposed to discuss was whether it was a primary etiological factor, for if so the proper alteration of the balance of the shoe must be an essential part of treatment, and the outward deviation of the great toe should not be dealt with as a mere isolated and unrelated deformity

In children about 11 or 12 years of age with everted or flat feet he occasionally saw an early stage of hallux valgus, and had noted that the skin on the inner aspect of the great toe, as well as that on the inner aspect of the head of the metatarsal, had hard callosities on it, similar to those in more advanced cases These showed that the child had already adopted the gait referred to in the opening paper as rolling over the inner border of the foot instead of using the plantar aspect of the toe for propulsion Carrying the weight of the body on the toe in this way put a rotational stress on the joint, causing a sort of wringing of the joint which its ligaments were not constructed to withstand Joint surfaces would withstand much compression, whether by body weight or by muscular action, and ligaments would tolerate considerable tension in the line of their fibres, but they resented being twisted or stressed in wrong directions, and became inflamed and hyperaemic He believed that this hyperaemia was the main primary cause of the hypertrophic bone formation along the lines of attachments of the ligaments, the edges of the joint cartilages shared in the hyperaemia, and with continuance of the mechanical irritation the osteo arthritic changes increased Pressure of the boot might give rise to a bursa over the osteophytic outgrowth, this was secondary, and might be the patient's chief sorrow Sometimes there was considerable deviation of the toe without pain and without much outgrowth of bone, he thought that in these cases it would be found that there was little or no twisting of the toe, the body weight being carried pretty fairly on its plantar aspect If there was a septic "rheumatic" element present in the patient this would

contribute to the pain and irritability of any strained muscle ligament or joint, but in his opinion the essential factor was mechanical strain Before trying to support this thesis by referring to results of treatment, he briefly referred to the mechanism of the foot in what Sir Robert had referred to as correct heel and toe walking with the foot pointing forward The outer toes carried by the cuboid had but little mobility The inner three toes were carried by the three cuneiforms which articulated through the scaphoid with the astragalus by a freely movable ball-and-socket joint The first metatarsal and the great toe could further be abducted and adducted to a considerable extent This part of the foot could be freely pronated and supinated at the mid tarsal joint and was the propulsive element of the foot In heel and-toe walking the weight came first on the heel, then along the outer border to the heads of the fourth and fifth toes, and then the mobile inner part of the foot came into play and provided the chief propulsive action, in combination with the calf muscles and the pressure was taken fairly on the plantar aspect of the foot and toes When the normal and correct balance of this part of the foot gave way the foot became pronated, the weight was carried too much on the inner border of the foot, twisting stresses were produced in the ligaments of the tarsus, giving rise to pains associated with what was called flat foot, and when the similar stresses affected the metatarso-phalangeal joint the patient was on the way to hallux rigidus or valgus

The results of treatment, he thought, supported this view First in children with early hallux valgus and callosities on the inner aspect of the foot and great toe, raising the inner side of the heel a little and placing a wedge behind the head of the great toe, and perhaps also the second toe, had the effect first of all of deviating the body weight on to the outer side of the foot and preventing the child from walking on the inner side of the foot Secondly the wedge behind the inner part of the foot tempted the child to grip with the inner toes, an action which re-educated the proper propulsive action of this part of the foot With proper shoeing in this way he had seen early hallux valgus disappear but this did not always occur Next in the advanced case with a painful joint the stout sole in the boot with a bar behind the tread took the stress of body weight off the toes relieved the joints and more particularly the ligaments round the joints from recurring injury, and so allowed the traumatic inflammation to die down, thus relieving the patient from the symptoms which caused distress There was, therefore good ground for insisting that whether as a curative measure in very early cases, as a palliative treatment in later stages or as part of the after-care after operative procedure, it was essential that the balance of the boot should be correctly adjusted by the means considered best by the surgeon With regard to operative attack he added that in order to expose fully the outer aspect of the head of the first metatarsal (because there was considerable osteophytic outgrowth) he had adopted, on the suggestion of Mr Bankart an incision between the first and second toes, completely dislocating the toe to the inner side This gave a full view of every side of the head of the metatarsal He did not think he would adopt it as a routine but only for cases in which a complete clearance between the first and second metatarsal head was essential

Mr Naughton Dunn (Birmingham) pointed out that pain was the dominant factor which caused the patient to seek advice Deformity or rigidity of the great toe was often seen in patients who had no complaint about the functional efficiency of their feet, but if pain was also present they expected relief If relieved of pain they were satisfied and any of the reasonable operations which procured this did not seriously interfere with the efficiency of the foot A patient sometimes came because of pain in the foot a definite deformity of the great toe might be present and might be assumed by the patient to be the cause of the pain unless examination of the foot included careful consideration of other possible sources of pain the results of operation on the great toe would not satisfy the patient His own statistics showed that there was some other source of pain in 52 per cent of the cases in which operation was undertaken for deformity or rigidity of the great toe The coincident treatment of these sometimes less obvious sources of pain was essential to satisfy the patient Flat-foot and hammer-toe were as a rule obvious if present and the presence or absence of pain from metatarsalgia should be carefully investigated Painful corns on the ends of the toes or on the dorsum of the little toe were also complications of foot deformity which might require appropriate treatment As regards the great toe joint itself, the consideration of the cause of pain was an essential factor in determining the operative treatment There were two types of cases In the first and commonest type the pain was due to pressure This might be simply boot pressure on a normal metatarsal head, leading to bunion formation or the pressure might be aggravated by lipping and new bone formation of the head of the metatarsal In these cases if joint motion was painless the most satisfactory result would be got by removing the bunion and mesial half or the metatarsal head together with any other abnormal bone formation on the other surfaces of the head The shoe was then made to fit the foot Pressure on prominent bone was eliminated, convalescence was short, and there was complete relief of pain without diminution of function Secondly there was the type of case where joint movement was painful and deformity or the metatarsal head was present Oblique excision of the metatarsal head from above downward and forwards was then the operation of choice enough bone must be removed to allow of easy correction of the deformity but if possible the section should be made so that the lower surface of the shaft still rested on the sesamoid bones Sir Robert had mentioned the interposition of a flap in the operation, this he personally considered quite unnecessary he believed that local fascial and fatty flaps, by the possible inclusion of divided cutaneous nerves were largely responsible for the painful joint movement which sometimes resulted In his opinion the essential of the operation was simplicity—a straight rather than a curved incision a direct incision to bone, exposure and removal of the head, and closure of the wound by a double removable silkworm-gut suture Where joint motion was painful and there was no alteration of the contour of the metatarsal head, he thought the false joint was better obtained by removal of the proximal half of the proximal phalanx of the great toe This operation was especially applicable to the cases of persistently painful hallux rigidus in adolescent It was an operation which should not be undertaken where trimming of the head of the first metatarsal bone was also necessary, as there was risk of ankylosis taking place if two opposing raw bone surfaces were present Sir Robert had not mentioned the special circumstances in which he would consider removal of the sesamoid bones In Mr Dunn's opinion removal of the sesamoids was necessary only in cases where as a result of their ankylosis to the metatarsal head painful persistent callosities had developed from pressure In these cases removal of the sesamoids and the under surface of the head of the metatarsal bone was necessary to give relief

In summarizing his remarks he concluded (1) That 50 per cent of the cases of hallux valgus and hallux rigidus were complicated by some other disability of the foot (2) That in many cases of pure hallux valgus and hallux rigidus the cause of pain was boot pressure on prominent bone, and that in these cases removal of the prominent bone was the operation of choice (3) That where removal of the metatarsal head was practised the interposition of local flaps was unnecessary, and that these were the common cause of the painful unsound ankylosis which sometimes resulted (4) That when arthritis was present without deformity of the head of the metatarsal, a better functional result would probably be obtained by removing one half of the proximal phalanx.

Mr E Laming Evans (London) dealing with the question, considered that local pain especially pressure was important This had to be abolished before an operation was performed He was guided in the amount of bone to be removed by the condition of the soft tissues if these were infiltrated he removed a greater quantity of bone When ankylosis occurred after excision he removed more bone and in reduced a free flap, the end of the shaft of the metatarsal

bone being resected on the sesamoids In severe cases he advocated amputating the great toe Muscle re-education was necessary, especially of the extensor longus hallucis

MR P B ROTH (London) considered that the chief cause of hallux valgus was tight socks and stockings These were big enough when bought, but were the same shape for right and left feet, and after washing shrank more and more They were darned and redarned, and became smaller and smaller, they were only thrown away when the darns appeared above the level of the boots or shoes They distorted all the toes, and pushed the big toe outwards However well fitting the boots, they would not prevent hallux valgus if the socks and stockings were wrong Other causes were trauma, heredity, and chronic sepsis Some years ago he wrote "that the operation of removal of the head of the first metatarsal was so often followed by crippling of the patient for life that he could not think a few successes entitled it to be considered at all" He was led to write this sentence because he had seen several deplorable results of the operation performed by others But he knew now that he had been wrong, and he took this opportunity of saying so The deplorable results were due to bad technique or bad after-treatment, the operation properly performed in suitable cases was an admirable one He had been finally led to this opinion by a pronouncement by MR Mumford Little, who pointed out that there was no anterior transverse arch to the foot as is generally understood, and that consequently removing the head of the bone could not interfere with it He was in entire agreement with this statement In a slight case he prescribed shoes to measure and shaped to the feet, taking care that the socks or stockings were fully large He did not use toe posts or springs, he had never found them do any good In a more serious case, where there was a painful lump, with perhaps a bursa over it, he chiselled off the lump in addition, and tenotomized the extensor proprius hallucis if tight In a bad case, where there was considerable pain, or a very prominent unsightly lump, or where there were overriding toes, he excised the head of the bone, dividing the neck subperitoneally as close to the head as possible with a pair of bone-cutting forceps He did not remove the bursa, as he considered that it acted as a useful buffer during convalescence, and prevented the skin from becoming adherent to the bone Afterwards the bursa, being no longer required, gradually disappeared After the stitches had been removed the feet were massaged and gently moved each day for a month, and the patient was allowed gradually to get about on them At the end of two months women were able to wear ordinary ready-made two-inch heeled shoes in perfect comfort, and they could even dance for hours

MR W ROWLEY BRISTOW (London) suggested that MR Roth would retract in a year or two his remarks about the transverse arch of the foot, the existence of which he had denied MR Bristow regarded the preservation of the sesamoids as the most important point in the operation on either of these conditions, and thought that cases in which they needed removal must be very few These structures acted to a great extent as the buffer necessary for the new joint He agreed with SIR ROBERT JONES and the PRESIDENT that patients with a mild degree of hallux valgus, and not complaining of pain, were best left alone For the severe degrees of deformity, when pain was the symptom complained of, in his experience free removal of the first metatarsal head was the operation of choice Removal of osteophyte or part of the head, usually resulted in a stiff joint The other point mentioned in the opening paper, but not discussed referred to the after-treatment The patient, after excision, was allowed up in two weeks, a metatarsal bar being worn which prevented weight-bearing and pressure on the new joint The bar was replaced in a week or two by an anterior arch support made from a plaster cast As soon as the stitches had been removed massage and electrical stimulation of the intrinsic and extrinsic muscles of the foot were commenced and continued for two weeks The patient was taught to move the toes and exercise them for himself, and his early efforts at walking were supervised With free removal of the head and preservation of the sesamoids, followed by appropriate after-treatment, the results were satisfactory, and there was no tendency to recurrence of the hallux valgus deformity

DR G HOLMES (Harrogate) pointed out that occasionally cases of hallux valgus were sent to watering-places diagnosed as gout or osteo-arthritis, and that not infrequently gout or osteo-arthritis was associated with this condition Treatment by hot paraffin wax or steam baths would in the majority of cases remove the inflammation and pain, and should be followed by massage and re-educative treatment of the muscles Most patients could be persuaded to wear suitable boots, but it was necessary for the doctor to put them in touch with a competent bootmaker who would provide suitable footwear without the ugliness for which surgical bootmakers were so often responsible

THE OPERATIVE TREATMENT OF ARTHRITIS DEFORMANS OF THE LARGE JOINTS

BY

HERBERT FRANKLING, C B E, M R C S,

Honorary Surgeon to the Harrogate Infirmary and the Royal Bath Hospital

THE term "arthritis deformans" is used as indicating a "progressive non-suppurative disease of joints characterized by pain, swelling, and impairment of function leading eventually to deformities and ankylosis" It appears to be the most convenient term for the purposes of this paper, since it includes types of the disease possibly differing in pathology, and avoids any controversial suggestion as to either pathology or etiology In the short time at my disposal I wish to give some account of recent experience in the operative treatment of the disease as it has been worked out in a clinic remote from the advantages associated with a teaching hospital The invaluable help afforded by the writings of leading orthopaedists (many of whom are identified with this Section) has fortunately always been available and constantly laid under contribution

Operative measures have been undertaken in an attempt to meet one or more of the following indications (1) To relieve pain (2) To restore mobility (*a*) inability to carry out particular movements completely, (*b*) inkylosis (3) To remedy deformity (4) To arrest progressive change in the joint, and to hasten resolution by removal of diseased tissue The actual operations undertaken may be classified as (1) extra-articular (manipulation, tenotomy, etc), (2) arthrotomy, with more or less extensive intra-articular procedures

The frequent difficulty of fully meeting the indications by extra-articular operation has led me to resort to arthrotomy in an increasing number of cases, and with these latter alone this paper deals My experience of such operations in cases of arthritis deformans consists of 34 arthrotomies (performed on 28 patients), made up of 12 hip cases (11 patients) and 22 knee cases (17 patients) Of the 12 hips cases 8 were males and 3 females, the youngest was aged 17, the oldest 63—the average age being 43 years Of the 22 knee cases, 8 were males and 9 females, the youngest patient was 14 years of age, the oldest 66—the average age being 37

No patient has been submitted to operation who, after a careful clinical examination, did not appear to be a good operative risk, nor has any patient with an obvious focus of infection been operated on until this had been as far as possible eradicated Many of the patients had previously undergone a very thorough course of vaccine treatment—a procedure upon which some of my colleagues lay the greatest stress, deeming the "absence of response to a large dose of an appropriate vaccine" a sure criterion of the safety of operation Increasing experience would lead me to avoid operation in the case of a patient whom one judged incapable of a persevering co-operation in the after treatment, upon which the ultimate result largely depends The local conditions were in all cases investigated by careful clinical and *x*-ray examination, the latter preferably stereoscopic

In dealing with this disease I have from the first felt that one ought, whenever possible, to aim at a mobile joint

so in the e cases—the majority of my series—concerned with the treatment of end results, in which symptoms are caused by deformities the result of disease no longer active or actually at an end, some form of arthroplas y—taking this to me in ' the operative mobilization of any stiff joint "—was the operation of choice, arthrodesis being employed only to meet some special indication in two cases (knees) In only two cases (one hip, one knee) was a formal operation with interposition of autogenous fat-fascia membrane carried out, in these the Murphy technique was followed The remainder were treated by a procedure comparable to that described by Hildebrand as a " remodelling " operation, the main features of which are the removal of di eased and disorganized tissue and the reshaping of the articular surfaces to as near the normal as possible The details of this method were evolved slowly—the results in early cases undoubtedly suffering because too little was attempted Throughout I have approached these operations as primarily exploratory in character

HIP-JOINT

I have performed 12 arthrotomies of the hip-joint—1 Murphy arthroplasty, 1 excision of head of femur, and 10 remodelling operations

The joint is exposed by the U shaped or Murphy ' goblet" skin incision with temporary detachment of the great trochanter, care being taken not to jeopardize the blood supply of the flap by inclining the upper limbs of the U too much inwards A striking feature of the majority of the joints is the contraction and thickening of the capsule, which, far from being ' large and some what loose so that in every position of the body some portion of it is relaxed," was contracted, so that in every phase of the limited range of movement of which the joint was capable it appeared taut and unyielding This is, I believe, an important factor in causing limitation of normal movement Even complete division of this appears to me insufficient in view of the rapidity with which it unites, and I now excise it as completely as possible the ease with which a new " capsule " can be formed being well recognized After the capsule is divided and any bony adherence chiselled through the head of the femur is dislocated out of the acetabulum and the condition of the articular surfaces inspected Bony adherence involved the whole articular surface in only one case, and this was treated by a Murphy arthroplasty in two cases it occurred over a limited area, and in these I relied upon Horsley's wax rubbed into the resulting raw surfaces to prevent re adherence The few observations I have been able to make lead me to think this a trustworthy method In most of my cases the ligamentum teres had disappeared Osteophytic outgrowths from either the acetabular rim or femoral head are chiselled off, in one case great difficulty was experienced from finding the cotyloid ligament completely ossified—usually it is the head of the femur mushroomed out and misshapen which demands most attention In my early cases I did not remove the bone sufficiently freely Curved chisels of varying width are of great use in carrying out this part of the operation, as are also the special instruments devised by Murphy Resulting raw bony surfaces are made smooth by filing or the use of a burr and Horsley's wax thoroughly rubbed in Diseased cartilage is removed, areas of necrosed or carious bone are curetted, and the resulting cavities made as smooth as possible with Horsley's wax or if large and of suitable shape, filled with bipped fragments of the patient's fat Pedundant or diseased synovial membrane is clipped away—an insignificant feature of the hips I have seen Only once was a loose body found The femoral head is replaced and the range of movement in all directions noted Further remodelling takes place if necessary Certain muscles or tendons (notably the adductor longus) may need division When refixing the great trochanter the mechanical advantage of so doing at a lower level (as pointed out by Whitman and Platt) should be remembered

The limb is abducted as far as possible, and this position maintained during the early weeks of convalescence I have not always employed extension Passive movements are begun as early as the condition of the patient and he wound permit I have usually given an anaesthe ic the first time this is attempted

KNEE JOINT

I have done 22 arthrotomies of the knee-joint, a follow 1 Murphy arthroplasty, 2 arthrotomies 14 remodelling operations, and 5 synovectomies Two patients had to be operated upon and three had one knee opened a second t

The joint is approached by a long curved anterior incision, the patella being either split vertically or turned up after division of its tendon or detachment of the tubercle In incising the capsule due regard must be paid to the integrity of the lateral ligaments Flexion of the joint after division of any bony adherence of either patella or tibia gives a good view of the interior Degenerated or proliferated synovial membrane or fringes or ulcerated cartilage, and vascular granulation tissue are carefully dissected away and, if soft and necrosed, curetted or chiselled out, osteophytes growing from the articular margins removed, the resulting raw surfaces carefully filed smooth and thoroughly rubbed with Horsley's wax Loose bodies are sought for and removed Any contracted tendons which prevent full extension must be divided Three of the knee-joints in my series were opened in a comparatively early stage of monarticular arthritis with the idea of cutting it short by removing diseased tissue Little bony or cartilaginous change was present, and the operation consisted of a synovectomy as complete as the exposure permitted

After operation the leg is put up straight at first with thigh extension Passive movements are begun early and persevered with massage and active movements following as soon as the wound permits A few cases have been fitted during convalescence with the Ernst ambulatory splint

RESULTS

The only death in the series took place after a " remodelling " hip operation, the patient succumbing to alcoholic delirium on the ninth day There was no wound sepsis The upper limits of the U-shaped wound in one or two cases of both hip and knee showed a limited aseptic sloughing of the edge of the flap due to interference with the blood supply—a fact which determined my preference for a straight incision No patient suffered from shock sufficient to cause anxiety or to call for any special treatment, with the exception of one female patient aged 53, who, after a hip operation, needed continuous rectal saline during the night following the operation In only one case where pain was an indication for operation was there failure to cure it—a hip operation in a man of 47, where a second arthrotomy had to be undertaken before this symptom was relieved This patient developed during the first convalescence a sharp attack of acute polyarthritis with high temperature the remodelled joint being affected in addition to most of the other large joints—the only example of a post-operative flare up " I have encountered

In nearly all the hip cases the freedom of movement which at first resulted tended gradually to diminish as time went on Briefly I should say that of the 10 remodelling hip operations the resulting mobility was good in 1 case in 7 and bad in 2 The functional result of the Murphy arthroplasty was bad The knee operations have given on the whole better results in this respect than the hip ones, four of them presenting painless flexion to a right angle after sufficiently long time after operation to justify the belief that such improvement will be permanent In two of the three cases of synovectomy the result was not what was desired a result attained in one case only after a second and more thorough operation The third case, which twice gave a positive reaction for tubercle after inoculation (the micro copic examination of the tissue was not made and was heretofore subsequently lost The two cases of arthrodesis of the knee were attempted by the Murphy arthroplasty or by his joint saw but gave fair results The remodelling operations from the point of view of mobility can be classified thus good 7 fair 3 bad 2 In two cases the operation was too recent to judge

CONCLUSIONS

1 These operations were undertaken for the relief of whom, in spite of years of medical treatment were hopelessly crippled.

2 The results as far as the relief of pain is concerned were almost uniformly good, and in many cases there resulted a mobility beyond expectation in joints the stability and weight-bearing powers of which were excellent

3 In common with other observers I have found that results which were disappointing to the surgeon appeared to give satisfaction to the patient

DR WARREN CROWE (Harrogate) gave details of two patients operated on by Mr Frankling He insisted that patients for operative treatment ought to be able to take large doses of vaccine without any reaction occurring it was then much safer to operate

PROBLEMS IN THE TREATMENT OF ACUTE ARTHRITIS OF THE HIP

BY

S J IRWIN, M CH, F R C S,

Surgeon, Royal Victoria Hospital, Belfast

THE major problem in the treatment of acute arthritis of the hip is that of life saving This aspect of the case, however, will not be discussed further than to mention a recent method which seems to me to show some promise of success, not only in the disease under discussion, but also in the case of acute infections generally I refer to blood transfusion

Acute arthritis of the hip is a general blood infection The micro-organisms are virulent or, what amounts to the same thing, the resistance of the patient is low The disease is often fulminant in its rapidity Medicinal measures which take time are therefore discounted Surgical measures are difficult for anatomical reasons, and the mortality is therefore high The urgent demand of the patient is for specific antibodies, but it is hopeless in many cases to expect these to be manufactured by the affected person Wright has suggested the immunization of a suitable donor, and the transference of about 500 c cm of pure defibrinated blood to the affected person Although I cannot quote a case of acute arthritis of the hip in which this treatment has been successful, I have had one of acute arthritis of the knee in which a very anxious and apparently hopeless case was transformed within a few hours into a cheery convalescent, the phenomena, both subjective and objective, being exactly comparable to what one sees occur in the crisis of an acute pneumonia

With the above exception I have purposely avoided discussion of the early circumstances of the disease, such as the nature of the infection, the site of its origin within the joint, and the direction of its spread from this site, these being beyond the purpose of the paper Nor shall I discuss the difficulties arising from the presence of acute suppuration in a narrow space, far from the surface, nor the methods which are at present adopted for securing relief of tension and free drainage It is rather to the sequelae of the disease that I wish to direct attention It will be admitted of course, that, just as in cases of severe poliomyelitis, if orthopaedic principles have been observed during the acute stage, later difficulties will be materially mitigated Later problems, however, do present themselves, and it is of these that I wish to speak The patient has succeeded in weathering the first storm, but has been left with a limb already damaged, and is running the risk of becoming worse until a functionless and often painful lower extremity remains Let me state, at the outset, that I regard the influence of age as the vital factor from the standpoint of morbid anatomy, and a recognition of this must to a large extent determine treatment My interest

this problem was first aroused by a case which came under my care in 1917 with an acute infection occurring a few weeks after birth and involving the whole of the left lower quarter It was not at the moment, I regret to say, recognized as a case of acute arthritis of the hip, this fact being discovered only after the acute symptoms had subsided and when an x-ray photograph was obtained By this time the child a boy, was just over one year old He was beginning to stand up and the left limb was noticed to be in a position of flexion, adduction, and considerably shortened

A search into the literature disclosed the fact that as long ago as 1874 Thomas Smith of St Bartholomew's Hospital had accurately and exhaustively described as a definite clinical entity the acute arthritis of infants, specifying the main characteristics as follows

1 *Age*—Within the first year, often within the first few weeks or first few days of birth

2 *Onset*—Sudden, often preceded by traumatism In one case cited by him a woman with puerperal mania swung her child out of a window by the arm, the shoulder being affected subsequently

3 *Progress*—Rapid, to suppuration, limited to the epiphysis and the joint cavity The diaphysis always escapes

4 Involvement of *large joints*—hip, shoulder, knee, etc

5 Complete *destruction* of the whole epiphysis, leading to shortened, mobile, or flail joints

6 *Termination*—Rapid, either favourable or fatal Thirteen out of twenty two cases in Smith's series were fatal

7 Neither syphilis nor tubercle are *causal agents*

Smith's article makes, of course, no reference to the bacteriology except in so far as clinically he excludes both syphilis and tubercle In this case the cause was demonstrated it was due to *M tetragenus* Traumatism at birth was also a probable factor

Consideration of the morbid anatomy of the upper end of the femur of the infant as disclosed by x-ray examination affords a clear explanation of these clinical manifestations The head of the femur, being almost entirely composed of cartilage in infancy, is destroyed by the inflammation and suppuration, and the epiphysis rapidly disappears This occurred in the case under discussion, the problem then presenting itself was clear-cut and definite—namely, how best to treat a heavy and vigorous child of 15 months in whom there was a complete loss of the head of the femur The indications for treatment at the time seemed to be (1) against all operative interference, (2) to correct the deformity already present, this was done by forcible abduction and encasing in plaster-of-Paris for a short time, and then (3) to fit such an appliance as, whilst limiting the tendency of the femur to slip upwards, would allow of as much exercise of function as possible

In the absence of function it was clear that growth of the limb would be stunted, and the general deformity not only persist but increase Having removed the plaster of Paris a calliper splint was fitted, and for about two years this was used At the end of that time a knee-joint was introduced into the continuity of the side-irons I am not sure if the latter was judicious in the circumstances The boy himself is perfectly happy He gets about with ease, he stands and falls like other children, and to all intents and purposes is a strong and healthy lad He has at present three inches of shortening made up by a high heel, and he has developed some adduction which increases the effect of the shortening

Such, then, is the problem presented by an acute arthritis of the hip in infancy—a problem due to the early and complete absorption of the femoral head

The next problem is exemplified by the case of a girl somewhat older, aged 5 years At this age the head of the femur is mainly osseous, but not entirely so After ordinary treatment had been applied for a time and there was still a discharging sinus in the thigh, the child presented herself at hospital Separation of the head from the shaft of the femur was then found, a considerable portion of the neck having been absorbed there was also some periostitis in the upper part of the shaft Careful inspection of the x-ray photograph, however, revealed a certain amount of continuity in the bony structure of the neck, and it was therefore deemed advisable to foster this bony bridge in the hope that ultimately a neck would regenerate and so form communication, however irregular and ragged, between the head of the bone and the great trochanter For a considerable time, therefore, the child was kept in hospital on an abduction frame with moderate extension Later still a calliper splint was applied and the child allowed to get about, in the hope that use of the limb would promote bone formation Unfortunately, at this stage the child went

home to the country and discarded the splint an act which terminated for the time being if not indeed, for all time, the continuity of bone between the shaft and the femoral head Very little shortening has yet occurred and there is still a continuity of bone from shaft to head which, however is considerably deformed as the result of absorption The problem here is again a very definite one—namely, how to deal with a breach of continuity, partial or complete in the femoral neck I suggest in this that the object of treatment is first of all, to promote reproduction of bone whilst preventing further shortening Success in this objective *will leave a strut to the shaft, and will eliminate the* stability of the great trochanter slipping upwards upon the ilium The child has therefore been returned to her frame with extension and gradually abducted Treatment is, of course not yet completed There is still risk of the trochanter slipping upwards, but when the splint was *removed it did not do so, and it seems to me likely* that an ankylosis in good position will be the ultimate result Treatment has however, failed to secure mobility

The third orthopaedic problem is found in a girl older still, about 11 years of age when she came under treatment In this case the history, briefly stated, is as follows The child developed influenza in 1918, and *following* it an acute arthritis of the knee later still, an acute arthritis of the ankle These joints were treated by incision, the knee without drainage and the ankle with drainage The child did not, at this time, complain of the hip at all, but she was extremely ill and almost incapable of saying where she felt pain A year later when I saw her, it was discovered that she then had a dislocation of the hip X rays revealed this to be a pathological dislocation due to acute arthritis of the hip The patient presented herself with the usual deformities —flexion, adduction slight external rotation of the hip She walked with the aid of a crutch The knee was at this stage, freely movable but there was some ankylosis of the ankle in the position of equinus Subcutaneous tenotomy of the adductors allowed reposition of the head, and the hip was put in plaster in slight abduction After three months a walking calliper was fitted The hip-joint is placed slightly above the normal level, is mobile stable, and capable of good function and painless Here again was a *definite and clear problem A dislocation of the upper end* of the femur, the femoral head itself to all intents and purposes undestroyed so far as stability and mobility were concerned, but associated with it the absence or softening of the upper lip of the acetabulum The condition of the bone in this case accounted for its resistance to infection, and no doubt this resistance was materially assisted by the softening of the acetabulum and the dislocation of the joint which followed The calliper after being worn for four years has been discarded The hip-joint is painless, mobile, and stable, the only disability being a slight limp

The last problem to which I would direct your attention is that presented by an acute arthritis of the hip in an adult, a man, complicated as it so often is by a pathological dislocation In the adult one is dealing with a femoral head still more resistant to the influence of inflammation and infection, and except in those cases in which the inflammation begins as a definite osteitis very little destruction of the head is to be expected the brunt of the disease being borne by the acetabulum, whose upper lip yields and allows the head to escape upon the dorsum ilii By the time healing has occurred there has usually been so much shortening of the ligaments and capsule of the joint and so much inflammatory material filling up the acetabulum as to make reposition and replacement impossible Some *operation will have to be done therefore if the limb is to* become painless and capable of the functions of support and progression

In the treatment of these cases the requirements of the hip joint are, I take it (1) freedom from pain (2) stability, (3) mobility This is their order of comparative importance unless the patient sits at his work—for example if he is a shoemaker, or if the knee on the same side or the hip on the opposite side is already ankylosed In the case under discussion the man was a small shopkeeper and it was therefore decided to aim at ankylosis Through a Smith-Peterson incision the front of the acetabulum was exposed and its upper margin gouged free of cartilage The shaft of the femur was then divided close to the neck and the upper end of the shaft brought into contact with the ilium by abducting the leg A slice of the great trochanter was removed, but otherwise the upper fragment was left *in situ* The result is a firm bony ankylosis with a limb 2½ inches short This shortening might have been diminished by more abduction The limb is painless stable and mobile The man is able to stand upon it practically the whole day, although it is but six months after the operation

I do not, of course, claim that these few cases explain the problems which follow acute arthritis of the hip but they do illustrate one aspect of this somewhat difficult subject

DISCUSSION

Sir Robert Jones opened the discussion pointing out that pathological dislocation of the hip in children could sometimes be easily reduced Mr McCrae Aitken described his operative procedures in detail The President urged the early application of orthopaedic principles Mr Platt had found the thick capsule an obstruction to reduction in *the acute arthritis of infants*

LESIONS OF THE ULNAR NERVE IN THE REGION OF THE ELBOW

Mr Harry Platt (Manchester) presented some observations on the pathogenesis, prognosis, and treatment of certain special types of ulnar nerve lesion in the region of the elbow He divided these in to three classes

1 Nerve lesions associated with recent fractures of the lower end of the humerus
2 Late involvement of the ulnar nerve
3 Recurring dislocations of the ulnar nerve

He pointed out that the lesions in the first group were comparatively rare and usually formed a transitory complication of the fracture, but occasionally a severe neuritis persisted He had himself encountered 8 ulnar nerve lesions in 187 consecutive fractures of the lower end of the humerus In one case only did the symptoms of severe nerve-block persist after a period of six months This case was treated by operation and the nerve trunk displaced to the front of the elbow a procedure which was followed by rapid regeneration and recovery of function

Late involvement of the ulnar nerve was a well recognized clinical entity with a characteristic picture, including a definite sequence of events—namely (*a*) a fracture of the lower end of the humerus in early childhood (*b*) a latent period, which might be as much as fifty years, (*c*) the spontaneous development of an ulnar neuritis Various types of operation had been carried out for this disability but it was now realized that the most logical and effective procedure was anterior transposition of the nerve trunk

Recurring dislocation of the ulnar nerve was a condition in which the exact etiology still remained somewhat obscure The signs of neuritis of the ulnar nerve which developed in these cases demanded operative treatment and again the operation of anterior transposition was indicated

CLINICAL DEMONSTRATION

In the afternoon a clinical demonstration was held in Mr Basil Hall's nursing home

Mr S W Davy (Leeds) showed the following cases (1) myeloma of the femur treated by resection and bone grafting (2) calcaneo-varus, (3) five cases of spinal curvature treated by bone grafting in one of these a psoas abscess had occurred without disturbing the grafts (4) end to end transplantation in a case of old hemiplegia, and (5) four cases of spastic diplegia

Mr F W Gordon (Bradford) showed two cases of transplantation of the tibialis anticus into the peroneal muscles, and one case of transplantation of the flexor carpi ulnaris into a loop formed from the palmaris longus

A MAITLAND RAMSAY, M.D., F.R.F.P.S., President

DISCUSSION ON THE INTRACAPSULAR METHOD OF CATARACT EXTRACTION

OPENING PAPERS

I.—PROFESSOR IGNACIO BARRAQUER,
Barcelona

By a correct cataract extraction we mean the removal of the whole cataract without producing any mutilation or ectopia in the intraocular organs. The classical operation by cystotomy is an extraordinarily imperfect operation from a surgical point of view. Its principal defects are as follows:

1. The necessity of making pressure on the eyeball with little spoons or with the fingers on the lids to obtain expulsion of the lens predisposes to vitreous loss.
2. The entrance of different instruments (spoons, knives) into the anterior and posterior chambers to remove the remains of the lens from the eye, traumatizing the iris and favouring iritis.
3. The retention in the eye of the greater part of the lens capsule and the remains of the lens cortex, these are the cause of incarcerations, iritis, iridocyclitis, later plastic iridocyclitis, secondary glaucoma, etc.

To avoid all pressure on the eyeball, to avoid the entrance of unnecessary instruments into its chambers, and to remove the lens entirely within its capsule, is the only way to get rid of all those complications.

Many methods of intracapsular extraction have been practised since 1745, or since the time of Daviel, in order to obtain an ideal removal of the lens. Studying those different methods of intracapsular extraction, we can assemble them into two large groups—those that remove the cataract by traction and those that expel it by pressure on the eyeball. Among the first group, the more commonly performed are those of Kalt and Knapp, and yet their methods do not become popular, because in the greater number of cases the instruments employed for the traction of the lens break the capsule, and the operation often becomes an ordinary cystotomy with all its inconveniences, aggravated by the complications caused by severe traction on the zonule.

Among the operative procedures of the second group, the only one really worthy of mention is the operation of Smith, who by his clever technique, and by the brilliant successes obtained in many thousands of cases, has demonstrated in a clear manner the great advantages of the intracapsular extraction. Nevertheless, its performance by hands not so expert as his is often accompanied by vitreous loss and other accidents that spoil the success of a great number of operations.

In 1916 I arrived at the idea of the construction of a pneumatic forceps (cup) that would grasp the lens by its anterior face, and without breaking its capsule, by stretching would detach it from its attachments and pull it out entirely. Although in my first trials I successfully obtained intracapsular extraction, complications in the ciliary region made my statistics bad. Histological examinations of operated eyes and lenses, and preparations and experiments on dead eyes, enabled me to corroborate that the traction on the lens most frequently caused rupture of the fibres of the zonule at their ciliary attachment, causing haemorrhages and inflammation in this region. To avoid this inflammation it was necessary to disjoint the zonule from the lens by its lens insertions. This I secured after several changes in the shape of the cup and by giving a vibratory movement to the vacuum, which was carefully studied by Professor Gallemaerts of Brussels in July, 1922. With this apparatus one obtains a nearly instantaneous diminution in the maximum diameter of the lens, and the vibrations not being sufficiently strong to be transmitted the full length of the zonular fibres to their peripheral insertion, the fibres give way close to the lens and so avoid the harmful traction on the ciliary region.

At first I practised extraction combined with a large iridectomy, but I was very soon convinced that the defect in the pupillary sphincter was not only unnecessary but harmful, because it predisposed to incarcerations with all their ill consequences—iridocyclitis, secondary glaucoma and so on—and when I practised my operations without iridectomy prolapse of the iris was a complication that sometimes spoiled their success. The Hess peripheral iridectomy and the application of sutures in the flap improved my operation very much, although annoying vitreous ruptures sometimes occurred. By training my assistants in the manner of holding the lids, avoiding the least pressure on the eyeball during all the operative steps, and by paralysing the orbicularis by means of an injection of novocain according to the technique of Van Lint-Villard, this complication also disappeared.

My erisiphaque is in reality a zonulotome and a pneumatic forceps, because when grasping the lens and deforming it it immediately brings about rupture of the zonular fibres, and afterwards the operator, in withdrawing the instrument from the anterior chamber of the eye, drags along with it, as if in forceps, the cataract entirely separated from its attachment. As it is necessary to obtain a certain amount of deformation of the cataract in order to secure rupture of the zonular fibres at their attachment to the lens, and the solidity and elasticity of the lens being different in every case, it is necessary to determine the physical condition of the lens in order that the strength of the vacuum and the number of vibrations necessary to procure separation of the suspensory attachment without rupture of the capsule may be arrived at. The greater the hardness of the lens, the greater must be the intensity of the vacuum.

In withdrawing the instrument with the cataract attached, a movement of rotation must be made in such a way that while the upper border of the lens follows the concavity of the patellar fossa, without exercising any pressure on the vitreous or altering its shape, the posterior surface of the lens becomes anterior and its lower border is brought upwards across the pupil and out between the edges of the flap.

I need not explain the special way in which I prepare my patients, the details of the technique of my method, nor the post-operative treatment, because I have published it several times, and probably all of you know it, and I need only repeat that to get the good results I have obtained during these last years it is indispensable—

(1) To prepare the patient beforehand as regards his general condition.
(2) To make a careful study by means of the Gullstrand slit lamp and microscope of the physical conditions of the cataract.
(3) To be sure of the perfect sterilization of the eye to be operated on.
(4) To employ the previous suture of the flap.
(5) To operate with a perfect erisiphaque, well regulated beforehand with reference to the physical conditions of the cataract on which we are going to operate.
(6) Surely the most important point of the operation is to avoid always all pressure on the eyeball, either with the retractors or with fixation forceps, in cutting the flap, in making the extraction, and afterwards when one ties the sutures and puts on the bandage. Very little pressure causes rupture of the hyaloid, which, if not followed by loss of vitreous, at least allows that humour to enter the anterior chamber, and so brings about failure of what we attempted—namely, not to produce any intraocular disturbance.
(7) We must never divide, except in a few cases, the iris sphincter, and the very thin post operative bandage must be left untouched for several days after the operation, the absence of intraocular inflammation making unnecessary the dressings that are always harmful.

I can assure you that when I operate in my clinic under my ordinary conditions there are very few patients with senile cataract who do not have a black, central, and round pupil and with more than 8/10 of vision ten days after the operation. It is in patients with symptomatic, diabetic and myopic cataracts that the best results are obtained, as compared with those who have undergone capsulotomy. The reduction of the number of vitreous ruptures and the

absence of iritis ensure a large percentage of successes. I have practised cataract extraction by capsulotomy for sixteen years and by phacoeresis for eight years, and during the latter period the percentage of patients with normal visual acuity is more than double that in the former one, and the number of operative accidents and post-operative complications has diminished in the same way.

My operative technique is not difficult—it is only completely different from other cataract operations. Any ophthalmologist who can operate correctly on ten successive cataracts, and who knows practically the normal anatomy of the eye and the pathological anatomy of post-operative complications of cataract extraction, is able to learn rapidly the phacoeresis technique. This is demonstrated by the new statistics published by Drs. Barrera of Madrid, Saint-Martin of Toulouse, Guiral of Habana, Green of San Francisco, and others.

Whenever we do not obtain a black, central, and round pupil and more than 8/10 vision, it means that the cataract was not of the simple senile type, or that at the time of the operation either the operator or the patient was at fault.

H. H. SINCLAIR, M.D., F.R.C.S.I.D.N.,
Ophthalmic Surgeon Royal Infirmary, Edinburgh.

A PRELIMINARY NOTE ON THE INTRACAPSULAR EXTRACTION OF CATARACT WITH SPECIALLY DESIGNED FORCEPS.

I WISH in the first place to thank your Committee for the honour of their invitation which affords me the privilege of taking part in this discussion.

The subject of intracapsular removal of cataract has been widely known for many years. Colonel Henry Smith, who is present to-day, read a paper before this Association in 1903, and at that time had already had an experience of 6,000 cases in India. His method of operating by expression is well known, and many ophthalmic surgeons visited his clinic, among others Dr. Arnold Knapp of New York, in 1911. Dr. Knapp in the following year began his work in intracapsular extraction. His subsequent writings have sufficiently indicated his method of procedure with blunt forceps (Kalt's) and expression. Professor Barraquer, to whose interesting address we have listened this morning, developed, in 1916, his new instrument, which he has called the erisiphaque, and with which he has operated in many parts of the world.

The method of intracapsular extraction, of which I have now had some little experience, is performed with forceps. I have *not* had a *large number* of cases so far, and still hope that both technique and instruments may be further developed and improved with increased experience. I will not discuss the conditions of general health or that of neighbouring mucous membranes and teeth, which we know require careful scrutiny and often special attention before operation is undertaken. It may be taken for granted that prior to operation every possible care has been taken to ascertain by all methods at our disposal that the eye and its surroundings comply with the strict requirements of aseptic surgery. The state of the eye with regard to functional reactions is tested carefully in the usual way. The condition of the lens is examined with the pupil dilated by focal illumination, with the opthalmoscope, and with the corneal microscope two or three days prior to operation. The type of cataract and the stage of advance are carefully investigated but, so far as I am concerned, not as yet with sufficient certainty in the interpretation of appearances.

The forceps are blunt or toothless. The lower margins of the blades, which come into apposition when the instrument is closed, have a specially designed curve, are smooth, and meet in a clamp-like manner. The shanks of the forceps do not meet, and all projecting parts are carefully rounded off so as to cause no injury to the cornea or iris. The correct apposition of the blade margins is insured by 'stops' on the handles and too great pressure is prevented by an adjustable nut on one of the stops. The upper aspect of the closed blades forms a small spoon-shaped or boat-shaped cavity or cup. This is directed upwards when the instrument is in position, and can be clearly seen through the cornea. The lower aspect of the closed blades is convex and feels like, and, when the instrument is first placed in position, rests lightly upon the central part of the anterior capsule of the lens. The forceps, which I have had in use in its present form for some time, was modified from a pair of Kalt's forceps which I purchased in New York in 1920. It has been modified in size, in shape, and in action. Recently I have found that the capsule of the lens seldom gives way where the forceps take hold, and I believe this is in part due to the construction of the instrument.

Hitherto I have always performed iridectomy immediately after iridectomy the forceps are used. The blades are introduced closed through the central part of the incision, with the point tilted downward, so as to raise the edge of the corneal flap. As soon as the closed blades reach a position at or a little beyond the centre of the lens, they are placed still closed, lightly on the lens capsule and opened widely to 4 or 5 mm. During the opening movement the blades are held in light contact with the surface of the lens. The pupil margin, which I have often seen in contact with the outer aspect of the blades, are gently pressed asunder, and I have never seen the iris injured in any way or caught by the forceps. When the opening movement of the blades ceases the closing movement should begin without any delay, and as this closing movement begins the blades are gently pressed against the lens capsule. This gentle pressure is increased as the closure proceeds, so that the convex edges of the clamping margins of the blades dimple or indent the capsule into the soft subcapsular cortex of the lens. As the closing blades approximate, the pressure upon the lens is progressively increased, and at this stage it can be clearly seen through the cornea that a relatively large mound or capsule-covered cortex is forming between the blades. When the closure is complete, the cup of the forceps contains quite a considerable mass of capsule-covered cortex. This contained cortex distends the portion of capsule within the cup and during the traction which follows prevents it slipping from between the lower margins of the blades, and thus too great pinching pressure upon the capsule is unnecessary. The contraction and large size of the blades also helps to spread or distribute the strain upon the capsule. Note that the degree of approximation or pressure of the blade margins has been arranged prior to the operation by the setting of the adjustable nut on the lowest stop between the handles.

Immediately the forceps have been completely closed a gentle forward movement towards the centre of the cornea is made and the forceps held forward in this position for an appreciable period—say for five seconds or more. This first forward movement puts the lens capsule on the stretch all round, and begins the moulding of the lens. When this forward movement is considered sufficient, the direction of traction is altered so as to bring the greatest degree of tension to bear upon one part of the suspensory ligament at a time. If we suppose the cornea to be marked like a clock face as viewed from the front, I should begin the lateral traction forwards and to the side towards 2 o'clock and afterwards towards 10 o'clock and then toward 12 o'clock always maintaining a partially forward movement. The suspensory ligament appears to give way at one part at a time and always below the horizontal meridian. Once the rupture of the ligament has begun the subsequent separation is much easier and the ligament seems to strip off from the lens margin. In cases where the zonule gives way easily, the above stages of the procedure may not be noticeable. At this stage—which is often about half a minute but has varied from 10 to 15 seconds in one case to from 60 to 70 seconds in another—the lens begins to yield and to come forward at the lower part. This gives the impression that the lens has become free from its lower and lower lateral attachments. The forceps traction is constantly maintained but with a little less strength so as to bring the lens forwards and forward by a slowly. This slow gentle but continuous traction which I have found best gives time for the capsule of the remaining suspensory ligament attachments and assists the gentle and slow separation of the lens from its bed upon the anterior surface of the vitreous humour. At this point, where the retaining power of the suspensory ligament has largely given way, the lens begins to abut upon the

posterior surface of the corneal flap, and then on the margins of the wound It has now become considerably altered in shape, this varying in degree according to the consistency of the lens, which in its turn depends upon the type of cataract and the age of the patient In certain cases it is remarkable to see how much of the intact capsule with contained cortex may be drawn, like the narrow end of a pear, into and even through the wound, prior to the successful delivery of the lens The moulding of the lens in some instances suggests that the nucleus has altered its position in relation to the surrounding cortex While this shows the toughness of the capsule and the suitability of the forceps, it is not desirable if due to a preventable cause, such as too small an incision The lens having engaged in the wound, is slowly drawn through, but must be so held that when its maximum diameter has passed out it can be restrained from anything like a sudden, or even too rapid, a completion of its exit This is, I believe, important, because it is one of the manœuvres which helps to prevent vitreous from following the lens into the wound If the last third or quarter of the lens be held in the wound for a few seconds it appears to be finally pushed away by the resiliency of the corneal flap, which closes down behind it

After the extraction has been completed and the conjunctival flap has passed into good position, as practically always happens, there comes the question of the freedom of the iris from the wound I have always felt reluctant to introduce a repositor, and have found that stroking of the cornea may suffice, but if necessary the repositor must be used Atropine, if not used prior to operation, should be used immediately after

The dressing I use is a small round piece of lint smeared with vaseline and placed over the closed eyelids A round of Gamgee tissue is put over this, and fixed with a strip of half-inch plaster Then over all is placed a perforated aluminium shield which is held in position by two strips of plaster Both eyes are covered for twenty-four hours, after which the unoperated eye is left open and the operated eye has the dressing removed, leaving the shield only I use the shield with straps of plaster in preference to a bandage round the head, as I find it steadier, and it is not liable to tugging from movements of the patient's head on the pillow

GENERAL DISCUSSION

Lieut.-Colonel Henry Smith, I M S, said that this was a discussion of the different methods of intracapsular extraction of cataract and, presumably, of the relative merits of this proceeding compared with the capsulotomy operation He would draw attention as briefly as possible to certain issues on the importance of which enough stress was not laid

Control of the Lyelids.—Thorough control of the orbicularis, whether by novocain or by mechanical means, or by both when novocain failed, as it not infrequently did, was absolutely essential if the operator was to have a fair chance

The Incision.—For an intracapsular operation the incision should be 180 degrees commencing in or just behind the sclero-cornea It accidents turned it into a capsulotomy operation no harm was done one never regretted having room enough but always regretted having too little Bursting or the capsule in expression was almost always due to too small a wound, and generally due to the same cause in the traction form of extraction

The Strœlenau, Kalt, Knapp, and Sinclair methods were substantially the same They would, he considered, be all improved if the operator made traction with one hand and pressed a squint hook on the flat—the point directed upwards—on the lower third of the cornea to assist in dislocating the lens Dr Barraquer's method would, he thought, be improved by using the squint hook in the same way This would also render the capsule less liable to tear in all these cases Dr Barraquer still laid stress on not tearing the suspensory ligament some distance from the lens to do so would undoubtedly imply more force than was justifiable Having repeatedly examined lens for this very thing with a magnifying lens before Dr Barraquer commenced intracapsular extraction, he had never once found tags of suspensory ligament attached to the lens He did not think that the zonule was ever thus torn whatever method was adopted The detachment was always directly from the lens, so that they need have no fear on this issue, vibratory movement had nothing whatever to do with it There seemed to be a general demand for a less complicated instrument than Dr Barraquer's, and Messrs Down Brothers were likely to supply it in the near future

The Physical Condition of the Lens.—Too much stress was laid on this issue From the practical point of view it was either a hard cataract or a Morgagnian cataract, if the former the plain of the iris was pushed forward, if Morgagnian it was the most ideal for the capsulotomy operation, or for the procedure which he had long advocated—the least favourable for any of the other methods of intracapsular extraction Though the lens was a globe in which the different countries of the world could be made out, like Dromio's wife, these things, however interesting, did not help the operator, and the idea that the younger men must investigate every cataract and draw inferences bearing on operation by the newest methods of examining the lens rather tended to frighten him unnecessarily The younger men in later years would surely come to agree with him that they were taught a thousand-and-one terrors, which seemed after events bogies designed apparently to make sure that they would never draw blood and never acquire enough confidence to operate

Escape of Vitreous.—People talked as though escape were not incidental to the old operation Professor Parker of Detroit read a paper at the annual meeting of the American Medical Association in 1921, giving about 14 per cent in his experience of about 1,400 It was much more serious in the old operation on account of the lens matter and capsule left behind than in the intracapsular operation A large escape was as fatal as a choroidal haemorrhage a small escape was of no consequence Nature was unable to repair the large one, but was able to repair the small one, this was the only explanation why eyes with a small escape were as well as those with no escape

People seemed to swallow the conclusion that pressure and friction must do harm, therefore it did do harm, they drew a conclusion from one premise instead of two, and advanced no facts The epithelial surface of the cornea would stand a surprising amount of friction without showing signs of reaction, and considerable pressure and pressure-strain was well tolerated and need not be feared, always provided reasonable skill was used He had frequently extracted in capsulo down to 30 years of age, and a few times down to 25 without any sinister result No one operating on patients over 50 years of age would have to use half this amount of pressure-strain

Reference had been made to Dr Barraquer's cases in America Lieut.-Colonel Smith had had a similar experience There was no finer body of sportsmen in the world than American surgeons, but in every country there were a few who "shoot the pigeon sitting" Dr Barraquer operated on some cases and never saw them again, some of them were talked over or reported adversely, the venom losing nothing as it passed round The speaker was similarly treated at Chicago, but on independent inquiry it was found that the results were twice as good as reported 6/50 turning out to be 6/6, and so on

They were told that the old operation was satisfactory, why then this search for a better one? Their answer was Take the immature cataract as one of the many cases in which it was not satisfactory In this and every country they were very numerous, men in the prime of life—50 to 60—found themselves put on the shelf, so to speak, for five years, ten years, or even for life, until their cataracts were ready for the old operation The penalty of waiting was tremendous, the demand was insistent, and they must give such patients relief The old operation could not do it, but the new one could India with its 40,000 cataracts a year, mostly intracapsular, would determine this question

Mr M L HEPBURN (London) said that in proposing and performing a new operation the aim of the surgeon should be to remove the disadvantages of the old operations without introducing any fresh ones Only in this way could they arrive at perfection in surgical technique He was prepared to admit that Professor Barraquer's operation was an ideal one if no objections to it could be found Another point in bringing forward a new operation was to avoid exaggerating the weaknesses and disadvantages of the older operations so as to throw into relief the method which specially appealed to the particular surgeon in this connexion he dealt first of all with what Professor Barraquer called the principal defects in the operation of cystotomy

The exertion of pressure in any way was a decided objection to the older operations, but who in these days ever exerted this pressure with the finger on the lower lid—a most septic procedure? The necessary instruments entering the anterior chamber were at the most three and possibly only one and if all the instruments were sterilized together he failed to see any objection to this, except the danger of a patient moving his eye at the moment when any particular instrument was being inserted, in his experience accidents from this cause practically never occurred Then again, traumatizing the iris and favouring iritis" was largely a theoretical objection, without bringing forward numerical statistics, he was prepared to say that the degree of reaction following any intraocular operation was about equally divided between those in which the iris was cut and those in which it was left intact Again as regards the retention of lens capsule and remains of lens cortex in the eye—the only danger of lens capsule being left in the eye was that it might be caught up to the wound, which could be avoided by doing a simple extraction The retention of lens cortex was by no means so dangerous as formerly except when it was infected, and in these days of asepsis such a complication need not seriously be considered In the days when asepsis was not practised the retention of lens matter in the eye was to be feared but ophthalmic surgery had advanced in this respect concurrently with other branches of surgery

The chief points in favour of the various operations could be crystallized as follows

1 Intracapsular Removal of the lens entirely with its capsule and thus rendering a needling operation unnecessary Also in the Barraquer operation the elimination of all pressure on the globe

2 Simple extraction cystotomy operation To prevent the capsule being caught up in the wound

3 Combined extraction, cystotomy operation To obviate prolapse of the iris, and to enable the lens to be delivered with less pressure The objections to the two latter operations could be summed up as follows Prolapse of the iris in simple extractions and the inclusion of the capsule in the wound in combined extractions All other disadvantages or advantages usually advanced against or in favour of one or the other were of minor consideration and often had no foundation in fact

Skill in ophthalmic operations was acquired by continual practice, but all efforts were in the direction of lightness of hand when this was maintained at a high level the results by any method of operation were undoubtedly better In all intracapsular operations the rupture of the suspensory ligament was essential and the question was how much force was necessary for this to be produced satisfactorily In Smith's operation rupture of the capsule was accomplished by pressure from without, and while in skilled hands this amount of pressure was reduced to a minimum yet it was a principle they all tried to avoid as much as possible, and in Professor Barraquer's operation this was absent altogether In the operation now being discussed the force was exercised by a pulling action which in his opinion was preferable to the pressure method

In spite of the apparent advantages of the Barraquer operation they were faced with serious complications which militated against a perfect result and over which they might have little control In the first place, would the vacuum produced by the pneumatic cup hold the lens firmly enough through all the manœuvres it had to go through If it did not hold the suction action was communicated to other parts, resulting in the loss of vitreous and inclusion of the iris For the necessary pneumatic power they were dependent not on skill, but on the perfection of the electrical apparatus at their side It was true that they could partly control it by sliding their finger or thumb over the hole in the crisphaque and maintaining it there in a firm position but this firm pressure on a relatively clumsy instrument could not fail to produce strong contraction of the muscles of the hand which led to the reverse of light handedness so essential in ophthalmic operations Every advocate of the intracapsular operation did not deplore the loss of vitreous, but he noticed that Professor Barraquer mentioned were associated with the desire to maintain the integrity of the vitreous, and with this he entirely agreed He regarded the loss of vitreous as a distinct disaster although perfectly aware that fluid vitreous was easily replaced with very little effect on the ultimate acuity of vision but in a large number of cases any loss predisposed to detachment of the retina and other complications and he was convinced that any teacher of surgery and any exponent of the new operative procedures should never treat lightly the loss of vitreous He did not quite agree that "very little pressure causes rupture of the hyaloid" unless the hyaloid was weak as in some cases of myopia, or in a secondary cataract due to iridocyclitis, but when the vitreous was fluid the tendency to rupture was increased by undue pressure

Turning to his own experiences and those of his colleagues at Moorfields he added that he had done the operation once or twice himself and had been thoroughly convinced of its dangers Two of his colleagues had performed this operation many times, and from close study of their experiences (*Trans Ophth Soc*, 1923) he was satisfied that the loss of vitreous and other difficulties were far in excess of those experienced in the older cystotomy operations The loss of vitreous was 25 per cent in the one case and 23 05 per cent in the other, while the total amount of failures due to all complications including loss of vitreous was 40 per cent in the one case and 42 per cent in the other These mentioned other difficulties in the technique not found in the older operations, and from their own experiences over a series of cases they had now abandoned the operation altogether As regards the visual acuity attained as a result of the various operations there was nothing to choose between a successful intracapsular operation and a cystotomy operation Some advocates of the intracapsular method maintained that the patient had better vision afterwards than when a cystotomy operation had been performed, but, judging by their usual standards, he did not see that they could desire anything better than 6/6 and J 1 which occurred repeatedly after the latter operation On the whole he was strongly of opinion that the disadvantages of the Barraquer operation far outweighed the advantages and could not be recommended as the cataract operation of the future

Mr J GRAY CLEGG (Manchester) had had some experience of the expression method of intracapsular extraction but had been unable to satisfy himself that it was as safe as the older cystotomy procedure Some twelve years ago the late Professor Stanculeanu of Bucarest presented him with a pair of his avulsion capsule forceps used in much the same way as that which Mr Sinclair now employed He found that the capsule was often torn by them and he therefore had abandoned the method but he intended with the improved pattern or Mr Sinclair to return to it In the United States during 1922 he had watched Professor Barraquer employ his special procedure and he was struck by his great skill and delicacy of touch In several cases there were difficulties with the crisphaque on account of the unaccustomed electrical connexion and the report Professor Barraquer was hand carried to a certain extent The fact that the apparatus was delicate and required frequent adjustment formed a decided objection to its use by others in general In reply to a query by Mr Clegg at the International Congress of Ophthalmology at Washington two years ago about complications he stated that they were practically none He asked whether Mr Sinclair had resorted to his traction operations in all of the 6 recent extractions It did not appear certain that a

partial vacuum on the anterior capsule necessarily implied a vacuum in the vitreous Mr Clegg presumed that the head band and retractor was suggested by Colonel Smith as being better than production of paralysis of the orbicularis muscle by subcutaneous injection In this country Mr Clegg had found that most patients were as quiet as could be desired, and it was therefore only necessary in particularly refractory and uncontrolled persons to resort to measures to prevent the nut-cracker action of the lids

Mr Bishop Harman (London) said that the apparatus needed for the performance of the operation of Professor Barraquer put the procedure in a class by itself It could only be performed in a regular eye clinic where there was available every resource in equipment and skilled assistance, it was useless in the many places where most of their work had to be done Who would propose to carry such an elaborate installation into the country?—yet they had to operate in the country Again, the elaboration of instruments not only limited the sphere of the surgeon's operations, but it reflexly affected his mentality, and therefore his skill in operating If his attention was diverted to the care of a number of extremely complicated instruments it was certain he could give less attention to his patient, so that the primary object of the procedure was obscured

Of Colonel Smith's methods of expression he would say that the degree of force required for its performance, at any rate upon Europeans with their tough connective tissues, was unwarrantable Far greater risks were run by that excessive force than could possibly be entailed by a needling operation of an after-cataract formed by a dense capsular remnant His personal experience was all in favour of the safe simplicity of the extraction of cataract after cystotomy, and he would never submit a British patient to forcible expression within the capsule He was impressed by Mr Sinclair's experiments in removing the lens intact by forceps, and thought the procedure worth trying, for it did not entail dangerous violence

Mr Harrison Butler (Leamington) asked what was wrong with the ordinary method of cataract extraction Under the best conditions it gave about 95 per cent of reasonably good results, and the loss of vitreous could be reduced to about 2 or 3 per cent He invariably paralysed the orbicularis with an injection of novocain, and generally used a conjunctival bridge By this method he had reduced his vitreous loss to a minimum He had seen Barraquer's method of extraction and was not at all impressed with it the pump gave a great deal of trouble and the operation lasted about half an hour He was struck with the distension of the wound caused by the exit of the lens with the spoon, which seemed to add about 50 per cent to the thickness of the lens He could see no reason for adopting a method which was complicated and dangerous when the orthodox operation yielded such good results

Mr R J Coulter (Newport) considered the instrument shown by Colonel Smith unnecessary, since the same result could be obtained by the use of the lid hook as suggested by Colonel Smith himself, but held by the surgeon instead of by his assistant

Mr A L Whitehead (Leeds) speaking as a surgeon of some years' experience deprecated the use of complicated mechanism in any form of operative surgery In all branches of surgery history showed that such aids were sooner or later abandoned, in fact, the more complicated the apparatus the shorter was its reign In the hands of the originator or his immediate pupils excellent results might be obtained but the large majority of surgeons inevitably found that the complications outweighed the advantages Unless it proved possible to simplify Professor Barraquer's apparatus it would not be acceptable to the majority of ophthalmic surgeons

Colonel Smith's operation required no elaborate apparatus, but it demanded dexterity, skill, and an enormous experience which the opportunities of the average British surgeon did not supply Mr Sinclair's method seemed well within the powers of the average surgeon Should the forceps fail to hold the capsule the effect was simply that of a capsulotomy according to the plan of Knapp and Fuchs, but the loss of vitreous, about 14 per cent, was very much higher than was usual in the ordinary operation with rupture of the capsule by a cystotome The speaker very much doubted whether this operation had any real advantages over the usual operation which he practised—a combined extraction with a large section, a conjunctival flap, and capsulotomy by a cystotome In his hands, even in extraction of immature cataract, the percentage of loss of vitreous had been almost negligible, and the after-results were very good

Mr E E Maddox (Bournemouth) said that just after carefully studying Colonel Smith's excellent book about his operation, and whilst deliberating whether it would be justifiable to attempt it, he had had the good fortune to receive a flying visit from Major McKechnie, who arrived so full of enthusiasm for this operation that Mr Maddox seized the opportunity to ask him to hold the lids of a hospital patient while the intracapsular extraction was performed Mr Maddox adhered loyally to every detail as laid down by Colonel Smith, and the lens emerged so neatly, and left so good a pupil without loss of vitreous, that the speaker naturally became enthusiastic also He had treated about fifty patients, nearly half by Smith's method, and the remainder by removing the lens with a little loop made for the purpose, like a short-handled bent vectis Vitreous was lost in a good many, but the results on the whole were quite as good as with ordinary extraction He would not advise intracapsular methods for lenses fully ripe and suitable for simple extraction, but there were certain cases for which it was highly advantageous, more particularly those in which there was a tendency to gouty iritis or chemical glaucoma, likely to be precipitated by thickening of aqueous with dissolving lens matter Even when the other eye had been lost elsewhere, he had in three cases removed the lens in its capsule for reasons of this kind

As regards Barraquer's operation, the chief advantage claimed for it, of the absence of all pressure upon the globe might not be so unmixed a blessing as it seemed, for the alleged tendency to detachment of the retina would be lessened by simultaneous pressure upon the lower part of the cornea to compensate for the retirement of the lens from its bed, and the ideal operation might prove to be one in which the *vis a fronte* was supplemented by a *vis a tergo* It was not the vacuum in the sucker which would affect the retina, but the complete occupation of the wound by the lens during its exit, which prevented the entrance of air to fill the space behind it With an elastic sclera sufficient contraction no doubt took place to obliterate the potential cavity, but with a hardened sclera the danger of detachment might be great Intracapsular extraction by pressure from without demanded such intense concentration and alertness on the part of the operator, that it was not wise to attempt it under difficulties—as, for example, when overworked or indisposed

Dr Gordon Spencer (Mesopotamia) considered that the discussion was of great value A simple apparatus for any operation was essential, since in foreign countries the assistants were usually incompetent and replacement of instruments impossible This ruled out Dr Barraquer's operation Colonel Smith's operation was excellent in the right hands, but required too much practice Mr Sinclair's method held out great promise, because an intracapsular operation was desirable, so many patients returned to their homes with a secondary cataract and were never seen again

Mr O G Morgan (London) thought that two very important arguments against the intracapsular operations were the extremely common slight loss of vitreous and the association of iridectomy Although a large loss of vitreous was a tragedy and a small loss was dangerous, and was only one point removed in danger from capsule in the wound, strands of vitreous in the wound formed a track for infection, delayed the healing of the wound, and by contraction seemed to draw the iris, especially the pillars in iridectomy, into the wound, causing prolap

Cystotomy was neither difficult, if performed within two to three weeks, when the average patient was quiet, or dangerous if aqueous was not lost, thus preventing the prolapse of vitreous into the anterior chamber. A simple extraction, or one with peripheral iridotomy, was to his mind the ideal operation. By causing adhesion of the anterior and posterior parts of the lens capsule it prevented capsule in the wound, and, even if iris prolapse occurred twenty four hours afterwards, and this adhesion had taken place, this, the most serious complication of the operation, was avoided.

PARESIS OF THE ACCOMMODATION AS A LATE SEQUELA OF ENCEPHALITIS LETHARGICA

BY

A. L. WHITEHEAD, M.B., B.S., F.R.C.S.,

Leeds

Mild attacks of encephalitis lethargica are probably much more frequent than is generally believed. The symptoms are very similar to those of typical encephalitis but are transient and leave no permanent ill effects. They are often incorrectly diagnosed as influenza, but the ocular symptoms should indicate the true diagnosis. Diplopia, often very transient, and a slight paresis of certain extra- and intraocular muscles will always be found.

In one case under my observation in a child double vision was not complained of, but the parents noticed that the boy constantly misjudged distances and had difficulty in directing food to his mouth. Affections of the ocular muscles are probably the most common of all the symptoms of this disease in the acute stage of both severe and mild attacks. As a final result or sequela they are less frequently present.

Many cases have been recorded in which paralysis or paresis of the accommodation has been found in association with palsies of the external ocular muscles. As an isolated symptom it is much less frequent, and a series of such cases having recently come under my observation it seemed advisable to place them on record. Through the courtesy of Dr. Johnstone Jervis, the medical officer of health for Leeds, I have been able to obtain particulars of twenty four cases of encephalitis lethargica occurring in the Leeds area in the first six months of this year. Ocular symptoms were present in all in the early stages, and in some persisted for long periods. Most of the cases were serious, and the diagnosis was made without much difficulty. In the case of four patients who came under my care complaining of defective vision, the original illness had been mild, followed by a more or less complete return to good general health, in only one had a diagnosis of encephalitis been made.

The brief notes of these cases are as follows:

T. R. B., male, aged 23, was seen first on March 10th, 1924. Six weeks previously he had been ill for a few days with fever, headache and dilatation of the left pupil on recovering he found that he was unable to read ordinary print but his distant vision was unaffected. The dilatation of the left pupil gradually passed off and the pupils were now equal. Vision was 6/6 in each eye with normal refraction he could read J. 1 easily at 14 inches with + 2·5 D. sph. for each eye. The condition had improved in June so that he was able to read J. 1 with + 2·0 D. sph.

D. B., female, aged 16, seen on March 24th, 1924. There had been a sudden illness seven days previously with severe headache and diplopia lasting five days she was now unable to read. The vision was 6/6 in each eye, retraction normal. Paresis of accommodation was present she could read J. 1 with + 3 D. ph. On June 12th she could read J. 1 with + 2·5 D. ph.

E. M., male, aged 32, seen on April 28th, 1924. Four weeks previously he had had a severe illness with headaches and diplopia for about a week and encephalitis lethargica was diagnosed. Recovery was gradual and he now feels perfectly well but is unable to read. The pupils are rather large but react well and equal. There is a well marked paresis of accommodation corrected by + 2·5 D. sph. The right eye is hypermetropic vision 6/18, the left is emmetropic vision 6/6. On June 20th the condition was unaltered but on July 14th he was able to read J. 1 with + 2·5 D. sph.

W. F. T., male, aged 12, seen on May 5th, 1924. About a month previously he became drowsy and had diplopia. Subsequently he was heavy and very slow mentally and was inclined to sleep frequently during the day. He complained of inability to read any except very large print. The pupils were 6 mm. in each eye, reaction normal, he required + 1·5 D. sph. for J. 1. On June 19th he was much brighter and read J. 1 with + 1·0 D. sph.

There has been progressive but slow improvement in the case.

Paresis of the accommodation is apparently most common in the mild cases of encephalitis lethargica and it has not been observed as a sequela in any of the severe cases occurring in this district, except in association with such other ocular symptoms as inequality of the pupils, defect in convergence, or a complete third nerve palsy. It bears some resemblance to the paralysis of the accommodation which occurs in diphtheria epidemic, in that it appears in mild and somewhat atypical cases. It is well known to ophthalmic surgeons that a definite history of diphtheria is often very difficult to obtain in post diphtheritic cycloplegia—often the only complaint is of a mild transient sore throat during a diphtheria epidemic—or where diphtheria has been present in the same house or district. In three of my cases the original attack was so slight as not to direct attention to the real nature of the illness. It is on account of the diagnostic significance of this partial cycloplegia in association with the antecedent history that I have brought these cases to your notice.

Mr. HARRISON BUTLER (Leamington) had seen several cases of encephalitis during the previous six months, in fact, at one time several cases a day came to the Birmingham Eye Hospital. In all there was a history of influenza followed by the paralysis of an eye muscle. Unfortunately he had seen four cases in which the optic nerve was affected—three of retrobulbar neuritis and one of optic neuritis. Two were followed by almost total blindness and two made a complete recovery.

RELATION OF THE BLOOD UREA TO DIABETIC COMA AND TO THE DURATION OF DIABETES MELLITUS *

BY

CHARLES E. BENTON, M.D., B.Ch. Dubl.

As the blood urea concentration in cases of eclampsia and of diabetic coma is at present under discussion it may be of interest to publish some results which were obtained in a recent investigation on certain blood constituents in diabetic patients under treatment by insulin. Two cases of coma are described and a table is given showing the blood sugar and urea content of fourteen patients in whom the duration of the diabetes mellitus was known.

The estimations of blood sugar were made by Wallis and Gallagher's modification of the Folin-Wu method, those of blood urea by the method of Twort and Ardern.

CASE I.

A married woman, aged 56. Her aunt had suffered from diabetes mellitus and she had noticed the symptoms in herself six years ago. She had been treated for four years. On November 18th she had pain in her knees on stooping and lost her appetite. On the night of November 22nd she became somnolent and was admitted on the afternoon of November 23rd semi-comatose but unable to speak. The temperature was 97° F. and the urine contained much sugar and acetone.

One hour after admission, having had no insulin during the previous twenty four hours, her blood contained 0·2 per cent. sugar and 0·2 mg. of urea per 100 c.cm. On the morning after a diet of water only and 90 units of insulin, having been given four hourly fluid nourishment, the blood sugar had fallen to 0·2 per cent. and the urea had risen to 0·7 mg. per 100 c.cm.

On November 27th, on a diet containing 2 grammes of nitrogen, 110 units of insulin in the twenty four hours, the blood sugar was 0·3 per cent. and the urea 50·9 mg.

On December 11th, on a diet containing 9 grammes of nitrogen, 90 units of insulin the blood sugar was 0·12 per cent. and the urea 70·0 mg. per 100 c.cm.

On January 5th, on a diet containing 9 grammes of nitrogen, 90 units of insulin the blood sugar was 0·25 per cent. and the urea 70·0 mg. per 100 c.cm. of blood.

It will be seen that in this case the blood urea fell more or less concurrently with the blood sugar as the result of treating the diabetes.

* Extract from a report to the Special Committee on Diabetes appointed by the Medical Research Committee.

CASE II

An unmarried woman, aged 20, stated that appetite and thirst had for several months been unusually great One month previously she had noticed loss of weight For twelve days she had ceased to work owing to weakness On January 2nd, 1924, she felt definitely unwell On January 4th she "fainted" and was admitted to hospital sufficiently conscious to attempt, unsuccessfully, to answer questions The knee jerks and abdominal reflexes were then absent, but returned before the second examination of the blood was made One hour after admission, having had an almost protein free diet during the previous twenty four hours, the concentrations of sugar and of urea in the blood were respectively 620 mg and 27 mg per 100 c cm On the following day, after an enema of olive and castor oils, the administration by the rectum of half a pint of water every hour, and a total of 40 units of insulin, the figures were 250 mg and 41 4 mg

Thus, in the second case the concentration of blood urea was within the normal limits and actually rose as the blood sugar concentration decreased and the clinical signs of coma disappeared

Since the blood urea concentration is not necessarily increased in diabetic coma, it follows that the kidney threshold for urea is not necessarily raised One or two estimations done some time ago on the blood of eclamptic patients showed a normal concentration of urea These results and those of De Wesselow,[1] who studied the coma of nephritis, suggest that coma is not due to hyperuraemia Among the possible causes are an increase in the inorganic phosphates, a relative alteration in the amounts of the inorganic constituents, and an alteration in the hydrogen-ion concentration of the blood I am inclined to suspect some decomposition product of urea, but the estimation of such products is difficult

The table shows the blood urea concentrations of patients who had suffered from diabetes mellitus for various periods ranging from three months to seventeen years Only those patients are included whose histories were definite and intelligent Case 13 is the first case of coma described above, and the figures given are, as in all the other cases, those obtained on the first examination after admission Case 14 is the second case described In all the other cases the blood urea remained constant under diabetic treatment in hospital

TABLE

Case	Sex	Age (years)	Duration (years)	Blood Sugar (grams per 100 c cm)	Blood Urea (milligrams per 100 c cm)
1	M	27	1/2	0 098	28 1
2	M	28	1/4	0 088	25 0
3	M	40	2	0 137	31 5
4	M	63	17	0 113	25 6
5	F	16	2	0 207	23 5
6	M	66	1/4	0 173	29 9
7	F	23	1½	0 336	34 7
8	F	43	2½	0 137	31 5
9	M	46	3	0 138	48 7
10	F	52	3½	0 242	28 0
11	F	20	4	0 250	41 4
12	F	20	1	0 108	24 5
13	F	56	6	0 466	82 2
14	F	20	1/4	0 620	27 0

It is of interest to note that the patient Case 4 in this table had a systolic pressure of 160 mm Hg taken over the brachial artery by the auscultatory method, but no arterial thickening or proteinuria

It seems certain that the duration of diabetes mellitus does not necessarily raise the concentration of blood urea From this it may be inferred that the disease does not lessen the excretory power of the kidneys for urea

The research on which this note is based was carried out at St Bartholomew's Hospital The author is deeply indebted to Sir Frederick Andrewes, F R S, to Dr Mackenzie Wallis, and to the members of the staff who allowed access to their patients Towards the expenses of the research a grant was made by the British Medical Association

Summary

1 The concentration of blood urea in diabetic coma is not necessarily proportional either to the depth of the coma or to the concentration of blood sugar Low concentrations have been found in the coma of eclampsia

2 The concentration of blood urea does not necessarily rise in chronic diabetes mellitus Diabetes mellitus does not raise the kidney threshold for urea

ACUTE PNEUMONIC PULMONARY TUBERCULOSIS TREATED BY ARTIFICIAL PNEUMOTHORAX

NOTES ON TWO CASES

BY

JAMES TORRENS, M D, F R C P,

PHYSICIAN TO ST GEORGE'S HOSPITAL,

AND

A G E WILCOCK, M R C S, L R C P,

MEDICAL OFFICER TO LINFORD SANATORIUM, LATE HOUSE PHYSICIAN, ST GEORGE'S HOSPITAL

It is a matter of general experience that in a large proportion of cases of acute caseous tuberculosis (lobar pneumonic type) there is a fatal termination within three months of the onset of illness, while nearly all the remainder, who have succeeded in overcoming the initial toxaemia, succumb to fibro-caseous disease and broncho-pneumonic extension within eighteen months The very few who are alive at the end of two years tend to be hopelessly incapacitated by reason of extensive fibro caseous and fibroid pulmonary disease With the exception of the first case recorded below we do not know of one person, undoubtedly afflicted with this form of pulmonary tuberculosis, who is in good health and able to do Grade III manual work more than two years after the onset of his disease

Radiographic examination of this type of case shows that, in addition to the primary "pneumonic" focus, there is, within a few weeks, considerable secondary bronchopneumonic involvement of the remainder of the same lung, and also similar implication, to a variable extent, of the opposite lung, usually about its middle zone

It is reasonable to suppose that toxaemia will be limited and further spread of disease to the opposite lung be checked, so soon as the primary lung can be collapsed by artificial pneumothorax

Just as in the treatment by artificial pneumothorax of ordinary fibro-caseous tuberculosis the presence of definite (even considerable) disease in the "sound" lung need be no deterrent, if for other reasons the treatment is deemed advisable, so in the acute caseous form artificial pneumothorax should be attempted provided there be only small or moderate (up to one-third) involvement of the "healthy" lung

This almost inevitable secondary implication of the "healthy" lung is, however, one very cogent reason for beginning the treatment by artificial pneumothorax as early as possible, and another reason, equally cogent, is the fact that if treatment be delayed more than a few weeks the formation of tough pleural adhesions may prevent satisfactory collapse of the affected lung, and the efficacy of the treatment may be correspondingly impaired It is not usually possible to diagnose this form of tuberculosis with certainty till the second or third week, since it is liable to be regarded as ordinary pneumonia till about the fourteenth day, when the absence of crisis, the swinging

temperature, and the evidence of softening may lead to a correct diagnosis, the discovery of tubercle bacilli in the sputum may be expected towards the end of the second week but their appearance may be delayed for some time further In any event we consider that the diagnosis should be established and treatment commenced in nearly every case by the end of the fourth week, and in some cases quite a week earlier

At the present time there has not been recorded a sufficient number of cases of acute caseous tuberculosis treated by artificial pneumothorax to justify an opinion as to what percentage can be restored to health by this means, but we venture to publish a short account of our two first cases in the belief that the present very high death rate in this class of case will be reduced very materially provided artificial pneumothorax treatment can be employed sufficiently early in the disease

CASE I

A G a schoolboy aged 16 years was always quite healthy till January 20th 1922 when he contracted influenza He was treated by Dr Milne of Streatham who kept him in bed for two weeks after a further weeks convalescence the boy felt perfectly well and returned to school The following day February 11th he shivered and had three haemoptyses totalling about twelve ounces of blood He was put to bed and Dr Milne noted the rapid development of signs of consolidation in the upper half of the right lung and later on increasing infiltration of the right base At first the clinical picture resembled lobar pneumonia but no crisis occurred the temperature began to swing widely and by the middle of March in spite of the fact that no tubercle bacilli were found in the sputum on three occasions Dr Milne was satisfied that the case was one of acute pneumonic phthisis On March 23rd the late Dr Arthur Latham was asked to see the boy with a view to deciding whether artificial pneumothorax should be attempted Dr Latham agreed that this treatment would afford the only possible hope of recovery and on March 24th the boy was admitted to St George's Hospital x-ray photographs being taken on his way from the receiving room to the ward A few weeks later the onset of Dr Latham's fatal illness precluded his further attendance at the hospital and the subsequent treatment of the case devolved on the present writers

Condition on admittance (March 24th)—A pale wasted boy with hectic flush dirty tongue injected fauces and frequent cough he was obviously very ill indeed Temperature 102° pulse 120 respirations 28 The right lung showed diminished expansion especially of the upper half with increased tactile vocal fremitus solid dullness to percussion over the upper half back and front vocal resonance greatly increased some aegophony The breath sounds were tubular with many hard crackles and pleural creaks over the upper and middle lobes The lower lobe showed impaired resonance and many medium and fine crepitations The left lung was hyperresonant and emphysematous with a patch of fine crepitations in front of the axilla and a band of hard crepitations to the left of the vertebral column (conducted from the other side) The heart which was dilated gave sounds of poor quality there were no murmurs

A skiagram showed much fibrosis with excavation of the upper and middle lobes of the right lung with pleural involvement and fine mottling all over the lower lobe There was emphysema and general tuberculous infiltration of the left lung chiefly in the lower lobe and most marked just external to the cardiac impulse

Subsequent Course of Case—It was considered advisable to collapse the right lung fairly quickly The first injection was given on March 25th no difficulty was met with and 320 c.cm of oxygen were introduced The initial manometer reading were −4 −8 cm and the final −3 −6 cm By the end of a fortnight five injections had been given nitrogen being used after the first day and satisfactory collapse had been achieved the final pressure after treatment was maintained at roughly −1 +3 cm A persistent adhesion from the apex to the first rib did not interfere with the collapse The sputum which after the first injection of gas was copious and loaded with tubercle bacilli ceased completely when collapse had been achieved and there has been none since April 1922 Constitutional improvement was slow but steady the temperature did not reach the normal for five months and was not stable for seven months the pulse remained high for several months but was down to 70—90 a minute by March 1923 The weight rose in eighteen months from 99 lb to 121 lb but has fallen a little since manual work has been undertaken

After nine weeks of treatment pleurisy with effusion developed on the right side with severe constitutional disturbance for several weeks This necessitated gas replacement of the fluid which took several weeks to reform in any amount after the chest had been completely emptied Finally the fluid though sterile became purulent and in July 1923, was so thick that it could not be withdrawn through any ordinary aspirating apparatus Accordingly 5 c.cm of Gauvain's fluid* was injected to liquefy the effusion and a few days later 18 oz were removed with success Since September 1923 the boy has been at a sanatorium where we are informed it was once necessary to liquefy and remove a thick effusion as described above but since then no fluid has formed and ordinary gas refills are performed every fortnight or so He is now doing Grade III work (pick and shovel and drawing a truck) is afebrile and without cough, the signs in the left lung have long since disappeared and he looks and feels perfectly well

*Camphor 1 part thymol 2 parts ether 3 parts.

CASE II

W H a schoolboy aged 15 was admitted to St George's Hospital on January 1st 1923 with a history of the sudden onset of illness with shivering pain in the right chest cough and expectoration ten weeks before Physical examination as well as x-ray photographs showed an almost identical condition to that described in Case I except that there was rather more implication of the left lung The same treatment was adopted but owing to the existence of numerous tough adhesions only partial collapse of the right lung was obtained in spite of the fact that the intrapleural pressure was raised at each treatment to +30 and +40 cm Nevertheless progress has been on the whole satisfactory the fever has disappeared there is neither cough nor sputum and moderate walking exercise has been permitted from time to time without obvious ill effect other than an increase in respiration rate By reason of the pleural adhesions it is now (sixteen months after the beginning of treatment) impossible to introduce any more gas and the lung has partly re-expanded though with a very thickened pleura and marked falling in of the chest wall

We do not maintain that this case is as satisfactory as the first one, and it is too early yet to say what may be his ultimate capacity for work or exercise, but we think that if he fails to make a good recovery it will be because he was not got at early enough to achieve full collapse of the damaged lung before the presence of multiple adhesions rendered this impossible

A CASE OF STREPTOCOCCAL MENINGITIS TREATED WITH SERUM RECOVERY

BY

C. WILFRED VINING, M.D. LOND., M.R.C.P. D.P.H.,

ZOOLOGIST AND PHYSICIAN CHILDREN'S DEPARTMENT LEEDS GENERAL INFIRMARY

AND

HERBERT P. THOMPSON, M.D., F.R.C.S. ED.

ASSISTANT PHYSICIAN HARROGATE INFIRMARY

RECOVERY from meningitis due to a haemolytic streptococcus is sufficiently rare to warrant placing the following case on record

A girl aged 10 of delicate constitution had been subject to mucous catarrh of the bowel and mild attacks of acidosis associated with an irritable patch dermatitis which were quickly relieved by treatment Adenoids but not the tonsils were removed during 1922

On March 14th 1924 she was sent home from school with mild tonsillitis and a temperature of 99°. On March 18th she complained of earache the tympanic membrane was hyperaemic but not bulging on March 19th the temperature was 100° and the pain in the ear continued On March 22nd the dermatitis was very troublesome but the temperature was 98° F On March 24th she had pain in the right ear and the breath smelt of acetone Vomiting occurred but was relieved by alkali On March 25th the pain in the ear ceased and she was better until March 30th when persistent vomiting recurred and the vomit was thought to contain pus Mr E. S. Steward of Harrogate examined the ear but did not consider there was any indication for surgical treatment There was slight hyperaemia of the tympanic membrane but no swelling or vertigo the ear appeared to be settling down A small amount of pus was squeezed from the right tonsil

On March 31st she complained of severe frontal headache and she saw two of everything and was confused and apathetic The temperature was 104° F and she was seriously ill the vomiting continued The neck was stiff with pain when the head was bent forwards The knee-jerks were not obtained and Kernig's sign was present Exploratory lumbar puncture yielded 20 c.cm of turbid fluid under increased pressure polymorphs 60 per cent lymphocytes 40 per cent No organisms were seen in direct films After the puncture the headache was relieved and the temperature dropped to 99.8°

The headache and general symptoms returned next day and the temperature was 103° F After the removal of 20 c.cm of fluid 15 c.cm of antimeningococcal serum were given intrathecally and 10 c.cm subcutaneously This was followed by great relief much generalized pain and considerable increase of the headache Towards the end of the next day (April 2nd) there was distinct improvement and the temperature dropped to 101° The pathological report upon the fluid was Fluid turbid the turbidity being due to pus cells composed of polymorphs 64 per cent lymphocytes 36 per cent No blood present Globulin reaction mild Globulin increased Culture on solid media gave a mixed growth of a short chained streptococcus which was markedly haemolytic in character Lumbar puncture was again performed

the pressure and turbidity were less, 10 c.cm. of antistreptococcal serum were injected subcutaneously.

On April 3rd the improvement was very distinct. There was no headache and the mental condition was normal. Kernig's sign was not obtained. Lumbar puncture gave only slightly turbid fluid under normal pressure. Next day 6 c.cm. of clear fluid were obtained by puncture, and the patient was quite clear from symptoms. Except for a serum rash on April 10th recovery from this point was uneventful.

Remembering the rarity of primary streptococcal meningitis, it may be questioned whether in this case the meningitis was not secondary to an ear infection. There was evidence of ear disturbance following mild tonsillitis, and although a streptococcus was not recovered from the throat, we are of opinion that the meningitis was definitely related to the primary naso-pharyngeal condition. At no time previous to the meningitis or during the illness was there any aural discharge.

Numerous instances have been recorded of recovery following operation for meningitis developing during the course of middle-ear suppuration. Such cases have been reported by Holger Mygind[1] of Copenhagen amongst a series of 210 cases of otogenic meningitis, and also by G. J. Jenkins,[2] J. F. O'Malley,[2] and E. Watson-Williams.[2] In many of these cases the cerebro-spinal fluid was turbid to the naked eye, and organisms were seen in the direct smears of the fluid obtained by lumbar puncture. Apparently in only a very small minority of the patients who survived were organisms recovered by cultivation, and in no case was a streptococcus obtained. In all the cases the meningitis followed ear disease, and with the exception of one of Mygind's all the cases were operated upon and basal drainage brought about.

The unusualness of our case lies in the recovery without operation after a streptococcus had been obtained by culture from a markedly turbid fluid. We have found records of only two cases parallel with ours—one of the series reported by Mygind which was not operated upon (no organism was, however, recovered by culture), and a case reported by Archer[3] from which a haemolytic streptococcus was recovered by culture.

We are of opinion that the serum administered by intrathecal injection was definitely related to the improvement which took place within twenty-four hours, and that the horse serum itself produced some effect of the nature of foreign protein shock which resulted in the stimulation of the child's antibacterial powers.

It is hoped that the happy result in this case may stimulate others to treat energetically cases of meningitis, usually considered hopeless, by frequent lumbar puncture and early intrathecal injection of serum. In the absence of a complete bacteriological report it would seem worth while to make use of an antimeningococcal serum.

We wish to acknowledge the help afforded by Dr. Sinclair Miller, who carried out the bacteriological examinations.

OBSTINATE CONSTIPATION TREATED BY CRUSHING THE LOWER END OF THE COLON AND UPPER END OF THE RECTUM

BY

JOHN A. C. MACEWEN, M.B., C.M.,

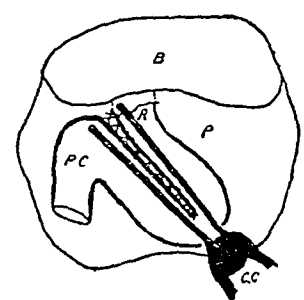
F.R.F.P.S. GLASG.,

SURGEON GLASGOW ROYAL INFIRMARY, AND LECTURER IN CLINICAL SURGERY, GLASGOW UNIVERSITY

The subject of the operation here described was brought to me by Dr. James C. Watt, of the West African Medical Service, who supplied the history and urged the operative treatment which was carried out by me.

The patient, a man aged 36, was robust as a boy, but during adolescence he developed chronic dyspepsia with constipation. He used to get very generally constipated and he began to suffer from headaches, drowsiness and tiredness on rising. When about 25 years old the constipation became severe, so that cathartics had to be used regularly, and the man became an invalid.

Right-sided abdominal pain and discomfort now became constant, and the pain in the hypochondriac region was so severe that cholelithiasis was diagnosed and the abdomen opened in 1922. No local lesion was found, but some peritoneal bands passed down to the ascending and transverse colon, matting these slightly, but not sufficiently so to cause noticeable obstruction. The appendix was removed at this time.



The patient was now hardly capable even of the lightest work, he was often melancholic, and "at the end of his tether." He was placed by Dr. Watt on a low protein diet and advised to use a bowel douche daily. There was immediate relief from all symptoms, the patient feeling happy and comfortable in body for the first time for years, but he could not regain a healthy degree of strength and still had attacks of obstinate constipation.

X-ray photographs taken in February, 1924, showed general atonicity and ptosis of the colon, characteristic of the asthenic type of chronic intestinal stasis. Shortly after this I was asked by Dr. Watt to see the case and consider the advisability of performing an operation to destroy sphincter action and kinking at the upper end of the rectum.

The patient was prepared for operation by Dr. Watt, who lays stress upon the thorough clearing out of the system by practical starvation, with copious water drinking and daily enema, until the tongue is clean and the abdomen concave, then low protein diet for a couple of days, and practical starvation for twenty-four hours before operation. Sips of water are allowed immediately after the operation, morphine is given as required, and a low protein diet gradually re-established, beginning about forty-eight hours after operation.

Operation

The operation is simple and presents little difficulty in performance apart from the rather restricted space in the lower pelvis. With the patient in the Trendelenburg position, a vertical median incision was made in the lower abdomen, extending above the umbilicus. The bladder was turned forward, and the pelvic basin and pelvic colon exposed. A point on the pelvic colon, about four inches above the attachments of the peritoneal ligaments of the rectum, at which the kinking was marked, was chosen. A small incision was made at the apex of this kink into the interior of the bowel, and through this incision the blades of a large and powerful crushing forceps were introduced, one blade going into each limb of the V. One blade there-fore descended, as it was introduced, toward the rectum, while the other ascended the pelvic colon. The blades were introduced to their full extent so that the blade which descended toward the rectum reached the insertion of the peritoneal ligaments. As the clamp was now closed, the two limbs of the V were approximated, so that four inches of the end of the pelvic colon and the beginning of the rectum lay parallel to four inches of pelvic colon immediately higher up.

Outline diagram of pelvis: P, with bladder B drawn forward, showing crushing clamp CC inserted into interior of bowel through opening at apex of kink. One blade descends to rectum R (wavy line above R indicates line of peritoneal reflection); the other blade passes along pelvic colon PC. YYY indicates line of suture.

Care was taken at this stage to keep the mesenteric attachment of the bowel well away from the proposed line of crushing. The mesentery of both limbs was kept below, or posterior to, the position of the blades of the crushing forceps, and once this position had been assured the full crushing power of the forceps was applied.

The clamp was kept on for several minutes, and during this period a stitch was run along the junction of the two pieces of bowel above or anterior to, the blades of the crushing forceps, so as to minimize the danger of separation of the pieces of bowel on removal of the clamp. The clamp was then slipped out carefully, and the preliminary incision made at the apex of the V was sutured. The abdominal wound was then stitched up.

The idea of the operation is that, once the two pieces of bowel with which have been severely crushed have sloughed, a wide opening will be established between the upper end of the rectum and the pelvic colon, redundant pelvic colon and consequent kinking will be largely done away with, and in addition a sphincter action of the upper end of the rectum and kinking about the junction of the pelvic colon and upper rectum will be rendered impossible.

Certainly the results of the operation were remarkably good. The patient soon began to lose his melancholic symptoms, the tongue kept clean, and the bowels began to move naturally, once or twice daily, with the aid of a little olive oil. He has recently been able to leave for New Zealand, feeling fit and able for his work. A letter received from him at the time of writing this states, "I am keeping very fit and have a bowel movement twice a day."

REFLEX VASOMOTOR INHIBITION IN LOBAR PNEUMONIA

I DESIRE to record the following unusually well marked instance of reflex vasomotor inhibition in a case of lobar pneumonia the underlying factors doubtless exist in all cases of pneumonic consolidation The phenomenon described may therefore well be present in a less easily recognized or more transient form in all such cases, and must in the present instance also have escaped observation but for the old fashioned and apparently now unjustifiably discredited form of counter-irritation employed in treatment

A B a healthy English male 20 years of age was suddenly attacked with acute lobar pneumonia There was a well defined circular area of consolidation about four inches in diameter on the posterior aspect of the left lung immediately below the angle of the scapula The case displayed no unusual symptoms and treatment was mainly expectant with counter irritation in the form of linseed and mustard poultices over the affected region After poulticing for twenty four hours the skin involved showed the usual erythema with the exception of a sharply demarcated circular patch—corresponding exactly in size and position to the underlying consolidated portion of lung—the colour of which remained strikingly unaltered continuous poulticing only gradually succeeded in reddening it Recovery was uneventful

This case furnishes an elegant illustration of the nervous connexion between the skin and underlying viscera, and suggests the rationale of treatment of various disorders of internal organs by local counter-irritation

STRANGULATED HERNIA IN INFANTS

I HAVE been interested to read the remarks on strangulated and irreducible hernia in infants in the JOURNAL of July 12th 26th, August 16th, and September 13th The writers do not all clearly differentiate as regards the pathology of the conditions found, so that it is not always evident whether the hernias were *strangulated* (that is, whether the constriction at the neck of the sac was such as to interfere with the blood supply of the contents), *obstructed* (that is, interfering with the flow of contents through the lumen of the bowel), or *irreducible*, where no obstructive symptoms are present

In a consecutive series of 1,500 operations for inguinal hernia in infants and young children I have operated on three cases where true strangulation had occurred

CASE I

A premature infant (7 months) aged 5 weeks and weighing just under 4 lb was admitted to the Royal Hospital for Sick Children in June 1922 from the Maternity Hospital with a history of a right inguinal hernia present since birth Forty eight hours before admission the infant which was not thriving refused its feeds and vomited several times The bowels were constipated and the next evening the vomiting became faecal in character and the hernia was then noticed to be irreducible On admission the abdomen was distended and the scrotum tense and oedematous and an irreducible right inguinal hernia was present Immediate operation was performed practically without any anaesthetic The sac contained a drop of blood-stained fluid and a loop of ileum greatly congested and with the contiguous surfaces glued together by lymph A tight constriction ring was divided and the bowel returned to the abdomen The infant was sent back to the Maternity Hospital but only survived for fourteen hours

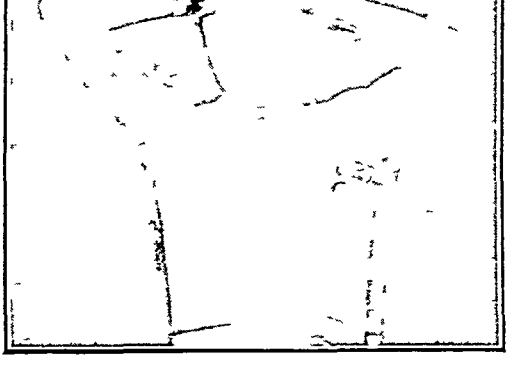
CASE II

J C a male infant aged 12 days was brought to the Children's Hospital with a history of a swollen scrotum vomiting and constipation for forty hours The child had been seen by a medical student the day before who having failed to reduce the swelling by taxis diagnosed hydrocele and did nothing further On admission a large irreducible left inguinal hernia was present the scrotum was swollen and discoloured At operation the hernial sac contained blood stained fluid and a loop of deeply congested ileum presented showing a circular gangrenous patch about the size of a sixpenny piece while the constricted portion of the gut was almost as bad After dividing the constriction at the neck of the sac the affected loop was pulled on until healthy bowel came into view and as invagination of the gangrenous portion was not possible a hasty resection of 4 inches of bowel with end to-end anastomosis was performed The infant made a satisfactory recovery and has since been operated on for a hernia on the opposite side

CASE III

W W aged 2 years had a history of two days' strangulation of a left inguinal hernia At operation the sac contained blood stained fluid mixed with liquid faeces and some fragments of undigested nuts The strangulated loop of ileum had ruptured and was gangrenous Resection of 6 inches with end-to-end anastomosis and drainage of the sac was followed by a satisfactory recovery and the radical cure of the hernia was performed two years later

The irreducible hernia as seen in the adult does not occur in young children, for as soon as the hernia becomes irreducible it also becomes obstructed, and gives rise to vomiting and, if unrelieved, to distension and constipation At the same time, the great majority of such cases will reduce themselves if the infant is put to bed with the pelvis raised and a hot fomentation to the scrotum The infant falls asleep and almost invariably the hernia disappears Failing this very gentle taxis under light anaesthesia may be tried, and generally is successful



Where real strangulation has occurred, this is evidenced by oedema and discoloration of the scrotum, and operation should be performed without delay

ELONGATION OF BRACHIAL ARTERIES

THE illustration accompanying this note is reproduced from a photograph of a woman aged 77 who was admitted to Tooting Bec Mental Hospital in February 1924 I think the condition of her brachial arteries must be very uncommon They appear to be congenitally too long for the

upper arm, in full extension they are quite visible and resemble in shape a bent bow The appearance of the arteries with the arm in flexion is seen in the photograph, they close up like a U-spring The depth of the loop is about 2½ in I am indebted to Dr E H Beresford, medical superintendent of the hospital, for leave to publish this case

THOMAS LINDSAY, M D, Ch B Edin, F R C S E. D P M Lond.

SPONTANEOUS RUPTURE OF THE HEART

I SHOULD like to add another case of spontaneous rupture of the heart to the case published by Dr Gilmore (BRITISH MEDICAL JOURNAL, August 30th p 373) and the interesting series by Dr S Watson Smith (September 13th p 465)

In March 1924 a woman aged 67 who never complained of any symptoms of heart trouble retired to bed and was found next morning dead and half undressed on the bedroom floor

Post mortem examination showed a well nourished woman with marked deposit of fat The pericardial sac was filled with blood which was swabbed out The heart was slightly enlarged and fatty There was a vertical tear 1½ in long in the anterior wall of the left ventricle the heart muscle was very friable and the tear with minute white patches pointed at the edges were normal and there was no disease of the aorta

Reviews.

THE TREATMENT OF GOITRE

LAST May (vol i, p 786) we published a review of Professor de Quervain's book on goitre, in which he showed himself an ardent advocate of the treatment of Graves's disease by surgical measures Now we have Dr ISRAEL BRAM's more bulky volume, entitled *Goitre*,[1] in which the case for its treatment by medical means is presented with an advocacy more ardent still The former may be said to represent the case for the prosecution, the latter that for the defence, and if at times counsel for the defence somewhat overwhelms us with the torrent of his words, yet the conviction grows as we hear him to the end that he is pleading in a right cause, with sincerity of purpose and intimate practical acquaintance with his subject Dr Bram remarks in his preface that in most books on diseases of the thyroid gland practically all goitres are regarded as requiring surgical treatment at some time or other in their course, and that other measures especially where Graves's disease is concerned, are only mentioned to be dismissed Disagreeing whole-heartedly with this generalization, he desires to assist the general practitioner to classify cases into those amenable to non-surgical treatment and those amenable to surgical treatment, and also to indicate what methods bring about the best and the promptest results in those instances "obviously of non-surgical nature" Accordingly he provides a therapeutic classification of goitres, including in the non-surgical class simple parenchymatous hypertrophy, colloid goitre, puberty hyperplasia, and the hyperplastic thyroid swelling of Graves's disease or the diffuse non-encapsulated swellings of the gland, in the surgical class he includes adenomatous, cystic, and all other types of thyroid enlargement not included under non-surgical goitre This classification is perhaps as good, if not better, than any other, at all events it is convenient in reaching a decision as to the best line of treatment to be followed in each individual case Few will quarrel with Dr Bram's therapeutic classification, the surgeons perhaps least of all, in so far as simple parenchymatous, colloid, and adolescent goitres are concerned, but there will still be found many who will disagree with his bold inclusion of Graves's disease among non-surgical goitres Dr Bram does not make this inclusion without giving his reasons, and we think that the unprejudiced general practitioner will find them at least as sound as those on which others base their arguments for regarding this complex disorder as primarily a disease of the thyroid gland curable only by removal of the major portion of the organ

After dealing with the anatomy and physiology of the gland, Dr Bram goes on to consider the diagnosis of goitres He insists that right therapy can be based only on right diagnosis, to be made only after a thorough investigation of each patient from every point of view—environmental as well as physical and mental Individualization, combined with the careful selection of the measures to be employed, and the concerted and harmonious action of medical attendant and patient, comprise the measures "upon which success is assured" Three chapters, about fifty pages, are devoted to endemic sporadic and puberty goitres, twenty chapters or approximately 350 pages to Graves's disease The author considers that endemic goitre is caused by 'a geographical deficiency of iodine in the air, food, or water', this view is too narrow, and loses sight of other important factors in causation Sporadic goitre he regards as being due to a variety of causes among which are heredity, puberty, adolescence, pregnancy, lactation, menstruation, disease of the female reproductive organs, focal infections, and acute infectious diseases 'none of which are dependent upon a deficiency of iodine intake' As to the causation of Graves's disease he has nothing new to say, but his view that the malady is a generalized defect in the action of the vegetative nervous system and of the entire chain of endocrine organs is a good working hypothesis for those who have to treat the disease The last 200 pages, which deal with the management and treatment of Graves's disease, are the best in the book Although "there is no specific method of therapeutic procedure" the author affirms that "the properly equipped internist, after eliminating those who are moribund, the insane and the non-co operative, all of whom constitute approximately 10 per cent of patients who apply for treatment, should obtain 100 per cent recoveries" by the judicious application of psychotherapeutic, hygienic, dietetic, and medicinal measures In the ardour of his advocacy of the non-surgical treatment of Graves's disease, Dr Bram has made his book too lengthy, and its size may make the busy practitioner shy of embarking on its perusal This would be regrettable, for we agree with the author that the majority of cases of Graves's disease can, and ought to be, dealt with by the family physician, who must possess the requisite knowledge and understanding There is much truth in Dr Bram's assertion that "it is the dormant attitude of medical men in general that is responsible for thyroidectomies in Graves's disease" The reviewer recalls in this connexion the plaint made to him not long ago by one of our foremost thyroid surgeons "I wish there were more physicians who would undertake the treatment of these cases If there were, fewer would need to be sent to the surgeon" The book contains 150 excellent photographic illustrations and an adequate index

ENCYCLOPAEDIA MEDICA

WE welcome the appearance of the twelfth volume (Skin—Tuberculosis) of the second edition of the *Encyclopaedia Medica*,[2] of which the last volume was reviewed by us a few months ago (BRITISH MEDICAL JOURNAL, April 26th, 1924, p 751) Of the principal articles four are new—those on stillbirth by Dr F J Browne, on the sugar of the blood by Dr C G Lumbie, on injuries and diseases of the tendons and tendon sheaths by Mr A H Tubby, and on trench fever by Dr J W McNee Seventeen articles have been rewritten, and one article, that by the late Mr Alexander Miles, has been revised by a fresh hand (Sir D'Arcy Power)

The article on the skin, which is the largest in the volume, is the work of five writers, and appears to be the same as in the first edition Three subjects—the spleen, the stomach and duodenum, and the thyroid gland—are each the joint work of a physician and a surgeon On the other hand, the vast subjects of syphilis and tuberculosis are each described by a single writer The principal surgical articles, apart from those already mentioned, are articles on surgical affection of the spine by Mr A H Tubby, suppuration by Sir G Lenthal Cheatle, affections of the trachea by Professor Leonard Gamgee and Mr E M Woodman, and transfusion by Mr James M Graham Neurological articles have been contributed by Dr James Collier, who writes on the spinal cord, Dr Edwin Bramwell, who discusses syringomyelia and tendon-jerks, Mr David Lees, who deals with tabes dorsalis, and Dr E Farquhar Buzzard with tremors

Among the miscellaneous subjects we may call attention to the article by Sir Thomas Oliver on dangerous trades, and that by Mr T W Drinkwater on toxicology The article on stomatitis by Dr G F Still is an excellent practical discussion of the subject, for though the majority of such cases are often regarded as of minor importance, some may give rise to a great deal of trouble in practice He might perhaps have found space for an allusion to trench mouth and its relation to Vincent's angina *In Sir James Canthie's* article on sprue we see no reference to its treatment by *calcium and parathyroid* as *recommended* by Dr Harold Scott Such blemishes in so large a work do not detract from the general excellence of the new edition, now so rapidly nearing completion With the exception of the photographs in the article on small-pox, which are too blurred to be of much value, the illustrations are excellent

TREATMENT OF TUBERCULOSIS

THE second edition of the *Domiciliary Treatment of Tuberculosis*,[1] by Dr F RUFENACHT WALTERS, manifests the usual characteristic of second editions—namely an increase in size over the first With the yearly additions to knowledge this may be regarded as inevitable, but with books as with university curricula, in which there is a constant increment without a concomitant decline in the demand made on the student, a sad lack of appreciation of the principles of relativity is too often shown In his medical course the student is expected to spend a quite unnecessary amount of time on subjects which are of comparatively little use to him in after life, whereas he is given the scantiest opportunity for training in subjects which will be of vital importance to his after-efficiency There is so much respect paid to knowledge that it is only with the greatest difficulty that we can relinquish the idea of educating our sons on the teaching given to our fathers

No one will dispute the value of the two new chapters which have been added to this edition but it is a matter for regret that the space they occupy has been provided by increasing the length of the book rather than by eliminating some of its previous contents This would not have been a difficult task There is, for instance far more than is necessary on such subjects as the different kinds of tuberculins, on therapeutic serums, and on the value of the opsonic index—subjects open to so much doubt and ambiguity that a discussion of them is likely to afford little help to the general practitioner for whom the book is written On the other hand, the indications for artificial pneumothorax and the importance of secondary infections receive only brief recognition Apart from these defects the book seems to fulfil its purpose very suitably, and possesses the great merit of containing frequent references to original authorities where the subjects discussed may be studied more in detail

The second volume of the *Handbuch der gesamten Tuberkulose-Therapie*,[2] edited by Professor LOEWENSTEIN in collaboration with other authors, deals with the subject mainly on an anatomical basis, the organs being taken in order Special chapters are devoted to a more general treatment of the subject, thus the specific treatment of tuberculosis, its relation to the endocrine glands the chemotherapy of tuberculosis, home treatment, and tuberculosis in the tropics, receive separate consideration

Professor Loewenstein expresses the opinion that the only sure test of recovery is the disappearance of the bacilli—a test which is most readily applied in cases of pulmonary disease Of 682 cases treated, some with old tuberculin and others with new tuberculin, the bacilli disappeared from the sputum in 52 93 per cent, a result which compares favourably with that obtained from hygienic and dietetic treatment in which the bacilli disappeared in 12 per cent of the cases only It is asserted that almost all clinicians are now satisfied of the value of the specific treatment Animal serums, whether normal or immunized, have been proved to possess no therapeutic action Professor Carpi gives the statistics of 120 cases of tuberculosis he has treated during the decade 1910 20 by the production of artificial pneumothorax Of these, 26 were unfavourable for operation which was merely adopted as a measure *in extremis* in 28 there were complete or almost complete adhesions in 4 the patients were lost sight of, in 66 the indications were favourable for operation, and the clinical results were good in 33, the cure being definitive in 23

Among the numerous drugs in use much attention it is said, has been given of late years to gold as a specific remedy in tuberculosis The sodium auro-cyanide is reported to have given good results experimentally in guinea-pigs, and in the treatment of lupus but it was found to produce toxic effects, it was claimed, however, that these could be avoided by combining the gold with cantharidine and ethylene-diamine, as in the preparation 'aurocantan" More recently a somewhat similar compound—krysolgan—has been recommended as having a direct action on the tubercle bacilli There has been much discussion as to the degree of toxicity of these compounds and reports have not been infrequent of such complications as rashes, nephritis, oedema, stomatitis and gangrene of the mucous membrane, following their intravenous injection Like all heavy metals, gold is a capillary poison loosening the cement substance of the endothelium, relaxing the musculature and tending to produce necrosis and gangrene apparently the right compound for intravenous injection has yet to be discovered

The volume affords a detailed survey of the therapy of tuberculosis from many standpoints it contains a bibliography, and the views and experiences of different authors are discussed

EPILEPSY

DR DONALD FRASER has written a book entitled *Clinical Studies in Epilepsy*[3] *in which he endeavours to deduce the* possible cause of the idiopathic form of epilepsy from a study of the symptomatic cases where there is a definite lesion to account for the seizures He has been much influenced by the work of Hughlings Jackson who he believes laid the only foundation on which we can build satisfactorily for the future Dr Fraser takes the view that there can be no psychogenesis of epilepsy as has been suggested by some writers of the psycho-analytic school, and holds that for a chronic disorder affecting nervous structures and tending to cause deterioration in them we must seek a material causation no matter how great the psychic involvement may be Unfortunately we are still entirely in the dark as to the causation of idiopathic epilepsy, and we cannot be said to have advanced appreciably either in our understanding of this disorder or in its treatment since the time when Hughlings Jackson expressed the view quoted by Dr Fraser that 'there is in a case of epilepsy grey matter which is so abnormally nourished that it occasionally reaches very high tension and very unstable equilibrium and therefore explodes"

The opinion reached by Dr Fraser following a survey of the various theories of epilepsy and a study of his clinical material is very similar to that expressed by Hughlings Jackson in the above quotation He stresses the effects of two main conditions as the only essential or necessary factors in the induction of an epileptic seizure of any kind these are a toxin or toxins, wherever and however produced, noxious to cell or vessel, and a cerebro-spinal or cerebral reflex set up by the irritation of strain or defects in parts or centres serving special functions—a state analogous to Hughlings Jackson's irritable or explosive grey matter It cannot be said that the views here advanced have any immediate practical bearings upon the treatment of epilepsy, but they certainly suggest directions in which research might be expected to add to our knowledge of this distressing disorder Important advances have been made in physiological chemistry and it may be that in course of time it may be possible to discover something like the *hormone y* which the author postulates as an important factor in resisting the influence or the toxin or toxins which initiate the epileptic movement

THE PHYSICAL CHEMISTRY OF THE CELL

At the close of last year (November 24th, p 989) we had occasion to review in these columns the first part of the fifth edition of Professor HOBER'S book on the physical chemistry of cells and tissues Our welcome was tempered only by the regret that the publishers had not seen fit to indicate the scope of the part which was yet to be published The omission is now repaired by the appearance of this part and our appreciation for the renewed labours of the author becomes unreserved

The duty of a reviewer of a volume which has received

[1] *Domiciliary Treatment of Tuberculosis* By F Ruf nacht Walters M D B S M R C P Lond F R C S Eng Medical Director Crook burn Sanatorium Second edition London Baillière Tindall and Cox (Post 8vo pp xi + 283 7 6d net)

[2] *Handbuch der gesamten Tuberkulose Therapie* Herausgegeben von Prof Dr med Ernst Loewenstein Band II Berlin and Vienna Urban and Schwarzenberg 1923 (Imp 8vo pp viii + 1027 190 figures 9 plates Paper cover 33 75 bound 38 25 Swiss francs)

[3] *Clinical Studies in Epilepsy [Chapters I and II contain a Historical Introduction to the Epilepsies as Bearing on the Establishment of Idiopathic Epilepsy]* By Donald Fraser M D F R F P and S Glas Edinburgh E and S Livingstone 1923 (Cr 8vo pp 243 [illegible])

the universal benediction of its readers is not difficult On the one hand, he has but to advertise to its adherents the appearance of an edition new in material as well as in name On the other hand, the obligation remains to offer the book to fresh readers To all, then, whose thoughts enter the ill-charted forests where physical chemistry borders on physiology Professor Hober's work is proffered as the survey of a zealous explorer in the land The first part reviewed the principles involved The theories of solutions, ionic equilibria, the colloidal state, heterogeneous systems, catalysis, and enzymes were granted adequate preliminary treatment, and were followed by an authoritative discussion of osmosis and permeability in relation to the problems of the cell

The second part,[6] which we now have under review, first extends the argument to the phenomenon of narcosis, wherein the work of O Warburg, of Meyerhof, and of the author is admirably co-ordinated The bewildering task of marshalling the data on haemolysis, agglutination and sedimentation, irritability, pH and ion antagonisms, is attacked in a lengthy chapter on the physiological effect of electrolytes Here we welcome the due regard paid to the studies of Loeb, Osterhout, and the American school For the electrical properties of matter, membrane potentials, polarization, and electro-osmosis, a chapter is reserved, and others are devoted to absorption and secretion and to the energetics of metabolism

Enough has been said to indicate the magnitude of the labour It only remains to add that whilst we may regret that we have not in our language a book of the same scope and fullness, it is yet a matter for congratulation that so large a labour for the service of physiology has been accomplished, and is being maintained up to date

DISEASES OF THE EAR

IT is satisfactory to learn that the second edition of *Diseases of the Ear*, by DR KERRISON, has been so well received that a third edition has become necessary two years later There is certainly no modern book which attempts with greater success a comprehensive and detailed survey of the subject, and its popularity is richly deserved, but it is doubtful whether the additions and alterations the author has introduced into the later editions add very much to its value The merit of the book lies in the clear exposition of practical otology, it is such an account as could only be written by a master of the subject The sections of aural surgery and the intracranial complications of middle-ear disease are brilliant It is gratifying to observe that the work of Albert Gray on oto-sclerosis receives recognition in this edition, but where the author writes from knowledge acquired second-hand he does not always succeed in carrying the reader with him Thus a chapter on tumours of the eighth nerve (an abstract of *Tumours of the Nervus Acusticus* by Cushing) has been introduced, and properly so, but the writing does not reach the level of the main body of the work The chapter on facial palsy again, is sadly out of date One unfortunate error still persists the illustration of Billance's plastic operation on the meatus shows the flap cut upside down These minor defects however, do not greatly detract from the excellence of the text-book, which we do not doubt will hold its own for many years

NOTES ON BOOKS

DR O BURWINKEL'S short and remarkably readable monograph on angina pectoris[3] is founded on twenty-five years' practice at Nauheim Angina pectoris is thought to have become much more frequent in recent years and to be no longer confined to middle age and advanced life, it is now, so we are told not at all uncommon to meet with well-marked cases in the twenties or thirties The importance of syphilis in the aetiology is emphasized at least 50 per cent of the patients giving a positive Wassermann reaction, although many of them appear to be genuinely unaware of their infection Abuse of tobacco, especially excessive cigarette smoking, is held to be another important factor After a graphic description of the symptoms the author discusses the prognosis, and, unlike some physicians, who are of opinion that death is inevitable within two or three years, maintains with Sir William Osler that life may be prolonged, and that even complete recovery may take place in a small number of cases Special attention is given to treatment, including operation, though the author does not appear to have any personal experience of its results A short bibliography, consisting mainly of German works, is appended

DR L MEUNIER'S *Histoire de la medecine depuis ses origines jusqu'a nos jours*[9] appears to be a reprint without any additions or changes of the edition published in 1911, though this perhaps does not make the same difference that it would in works on other aspects of medicine, it is not a recommendation to a history of medicine Its nine chapters deal respectively with medicine before, during, and from the time of Hippocrates to that of Galen, the interval between Galen and the sixteenth century, the sixteenth, seventeenth, and eighteenth centuries, finally, two chapters are devoted to the nineteenth century It certainly contains an enormous amount of information, but even in this respect, and especially in the absence of the relief provided by portraits of the prominent figures in medical history, it does not compare favourably with Garrison's attractive *Introduction to the History of Medicine*, now in its third edition

The work on *Fertility and Sterility in Human Marriages*,[8] by DR EDWARD REYNOLDS and DR DONALD MACOMBER, of Boston, contains five sections The first consists of three chapters dealing respectively with fertility and sterility as biological problems, with the frequency of sterile marriages, and with the mechanism of fertility The second section is devoted to a consideration of the determining causes of sterility in the female, which include chronic passive congestion of the pelvic organs, complete and partial arrests of development, specific and non specific infections, dyspareunia, displacements, and neoplasms The writers found that while in hospital work tubal inflammation due to gonorrhoea was very frequent, the percentage of tubal sterility of gonorrhoeal origin in private practice was very small The third section, which is from the pen of Dr Edward L Young, Jr, deals with the determining causes of sterility in the male, including diseases of the testicle, prostate, and seminal vesicles, as well as impotence and allied conditions In the fourth section relative infertility, the marital habit, and the prevention of sterility are discussed, special importance being attached to dietetic deficiencies as a cause of infertility The fifth section consists of two chapters, the first of which describes the method of examining a case, while the second deals with the surgery of sterility, special attention being given to transuterine insufflation of the Fallopian tubes, which was first introduced by Rubin of New York in 1920

The unfinished manuscript of a little book on diagnosis by laboratory methods at the bedside was found among the papers of the late Professor CHARLES LESIEUR It has been completed by Professor G MOURIQUAND, his successor in the chair of general pathology and therapeutics in the Lyons Faculty of Medicine The work is divided into three parts In the first a description is given of simple methods employed for examination of the blood, urine, cerebro spinal fluid, gastric contents, stools, pus, sputum, and various effusions, the second part deals with the bacteriological examination of wounds and biopsies, and the third part contains a brief description, in alphabetical order, of the micro organisms associated with various diseases

Pediatric Nursing,[12] by MISS BESSIE INGERSOLL CUTLER, is designed to help the nurse entrusted with the care of infants and children It contains useful chapters on maternal nursing, artificial feeding of infants, food for the child, nursing technique in minor surgery and general therapeutic procedures,

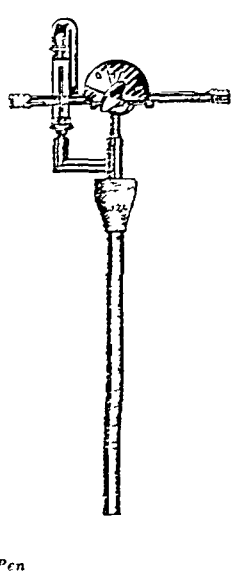
the nursing of infectious diseases, and surgical nursing Chapters on the mental development of children have been contributed by Frederica Beard, on the educational value of occupational therapy in the care of sick children by Susan Tracy and on the orthopaedic nursing care of children by Catherine A Smith A selected bibliography by Frederica Beard of works on mental development, elementary psychology, and practical child study is appended The work which is more advanced than most books of the kind, is characterized by careful attention to detail



PREPARATIONS AND APPLIANCES

Glax oro

We have received from Messrs Glaxo samples of Glax-oro and literature relating to it This preparation it is stated by the makers is a mixture of dried milk malt barley kernels and cocoa to which has been added a new preparation a vitamin concentrate prepared from cod liver oil It is stated further that Glax-oro contains this fat-soluble bone-forming vitamin from cod liver oil in a tasteless form and that it is an easily digestible nutritious food in a very palatable form The makers state that it consists of the solids of milk together with malt flour malt sugars, cane sugar and cocoa and they claim that its special value lies in its vitamin content since they state that Glax-oro contains vitamins B and C and both forms of the fat soluble vitamin A the growth promoting factor and the bone-forming or antirachitic factor The special and remarkable claim of the makers is that they have succeeded in their laboratories in isolating from cod liver oil a tasteless product which contains the antirachitic vitamin in 2 000 times as high a concentration as it occurs in cod liver oil A large amount of research work has been carried out in many scientific laboratories during the last few years on the isolation of the antirachitic factor of cod liver oil and remarkable advances have been reported in this country and in America Messrs Glaxo claim to have achieved a greater success than any previous workers, but if such a claim were made by a scientist it would not be accepted until all the methods had been published so that anyone could repeat the experiments We have no reason to doubt the makers claims for Glax-oro but we have not been able to test them because a full test of these claims would involve several months of highly specialized research We shall await with interest the confirmation of these claims from independent sources

An Oxygen Ether Apparatus

Dr W B Bacon (Royal Infirmary Manchester) writes The apparatus here described is intended for the administration of a constant quantity of oxygen with a variable amount of ether The supply of oxygen can be directed either in part or in whole through the ether so that the amount of ether can be varied from nothing the patient receiving pure oxygen to the maximum when all the oxygen passes through the ether The apparatus resembles the ether fitting of the Shipway apparatus but permits oxygen to be given pure by simply a turn of the tap no disconnecting of tubes being necessary The apparatus is small measuring only 9 inches by 3½ inches and is fitted with a bevelled cork so that it may be used in any ordinary necked bottle of capacity from four to twenty ounces A glass indicator is fitted to act as a safety warning should any of the fluid find its way into the outlet tube The tube for the oxygen is marked oxy The apparatus can be supplied by Messrs Billings and Sons Ltd 305 Oxford Road Manchester Although designed for the administration of ether it can equally well be used for chloroform and here the advantage of being able to give additional oxygen is undoubted

A Fountain Pen

The John Hancock cartridge pen sold by the J P H Syndicate Ltd (23a Old Bond Street London W 1) for 25 with a pocket case containing three cartridges is constructed on a principle we believe to be new It is charged by introducing into the barrel a sealed cartridge containing ink by screwing down the cartridge is directed the seal is punctured and on replacing the upper end the pen is ready for use and will write for as long as the ink lasts The merits of the pen are that a spare cartridge can be carried without the risk of inking clothes and as there is no joint at the nib end can be used without risk of inking fingers The drawbacks are that the pen is useless without the cartridges and that these cost 1d each The manufacturers claim that 10 000 words can be written with one cartridge but we have not obtained nearly so many The contrivance is perhaps better suited to carry in the pocket than for use at the desk

Nova et Vetera.

SIR ROBERT MACARA, K C B,

SHIP'S SURGEON AND PENINSULAR VETERAN

During the eighteenth century, from about 1750 to 1780 it was not uncommon for junior officers of the Indian Medical Service to hold combatant commissions in addition to their *warrants as assistant surgeons It was not until 1782 that* commissions were given to all officers entering the Company's medical service, before that date all, with the exception of a few seniors, were warrant officers only It appears clear that *no general custom of holding* such double commissions as ensign and assistant surgeon or lieutenant and assistant surgeon ever existed but undoubtedly many individuals did actually hold both and carried out the duties of both position either simultaneously or by transfer from one to the other as required It was only in the junior ranks that such double duty was permitted When the turn of an officer holding such a double commission came for promotion either regimentally to captain or departmentally to full surgeon he had to make up his mind either to accept the promotion offered or definitely to decline it once for all, and await his turn for promotion in the other branch Some made one choice some the other In one case at least that of Francis Balfour a distinguished Oriental scholar his juniors in the medical service bitterly resented his choice of medical promotion, and several of them submitted petitions to Government against his return to the Medical Department after some ten years of military and political duty Government decided in favour of Balfour, who subsequently rose to be the head of his service

The most singular case, however of an officer doing both military and medical duty is that of Robert Macara, who served the East India Company for nearly twenty years (1784-1803) as surgeon of an Indiaman while all that time holding a combatant commission in the British army, with gradually rising rank

Robert Macara was the only child of the Rev Duncan Macara minister of the parish of Fortingal in Perthshire from 1754 to 1804 and his wife Susanna Robertson The date of Robert's birth is not known but he was baptized at Fortingal on May 6th 1759 so was probably born early in that year He matriculated as a student of the United Colleges of St Leonard and St Salvator St Andrews at the age of 14 in the session of 1773-74, and went through the arts course for four years, but left the university without taking a degree On August 17th, 1783 he was gazetted ensign in the 95th Foot then a Highland regiment In the following year the regiment was disbanded and its officers placed on half pay An ensign's *half pay was small* and Macara had to find some other means of earning his living He chose medicine and on March 25th 1785 sailed from Portsmouth as surgeon of the East Indiaman *Podney* Where and how he got his medical education is not known His name does not appear in the roll of graduates or any of the Scottish universities As he was 23 when gazetted ensign he may have gone through a period of apprenticeship before 1782

Macara made six voyages to the East as surgeon of the *Podney* 1785-86 the *Thetis* 1786-88 the *Ceres* 1789-91 the *Valentine* 1792-93 the *King George* 1794-95 and lastly after an interval of six years the *Marquess Wellesley* 1801-03 The logs of these voyages are still extant among the marine records of the India Office These logs are dull and lengthy documents of over one hundred folio pages each filled with details of weather course and the usual routine of duty at sea Macara's name is not mentioned in any of them except in the lists of the ship companies The surgeon of an Indiaman *must have had very little professional work* to do though as they often carried drafts of troops on their outward voyage and invalids when returning there would be a small amount For the first five voyages Macara drew pay at £3 a month for the sixth £3 5 During the long war with France an Indiaman was always armed and at times it might meet a French man-of-war or privateer and passengers and crew alike had to be ready to fight for their

lives, or at least to escape a French prison An Indiaman, as a rule, was no match for a man-of-war, though they usually put up a good fight, and had some famous successes, notably in Dance's action in the Straits of Malacca on February 14th, 1804, when the Company's China fleet attacked and put to flight a squadron of French men-of-war One surgeon in the Indian Medical Service, William Spottiswood, was killed in action on August 14th, 1803, when the Indiaman *Lord Nelson*, on which he was a passenger going home to retire, was taken off Ferrol by the French privateer *Bellone* No such naval encounters, however, broke the monotony of any of Macara's voyages Several false alarms are recorded in the logs, when the ship was cleared for action, but no actual fighting took place

As already stated, Macara was placed on half-pay when his regiment, the 95th Foot, was disbanded in 1783 Almost all the battalions numbered above 70 were reduced in that year After twelve years he was promoted (December, 1795) to captain in the 94th Foot, but did not do duty with it When he reached England on July 21st, 1803, on the *Marquess Wellesley*, at the end of what turned out to be his last voyage, he found orders awaiting him to rejoin the army Three weeks before he had been gazetted captain in the 42nd Foot—the Royal Highlanders, or Black Watch He joined his regiment at once, and his serious military career began, at the age of 44, after twenty-one years of only nominal service in the army His rank as captain was dated from December 16th, 1795 The *Army List* of 1804 shows him as fifteenth out of eighteen captains in the regiment, that of 1805 as seventh In November, 1805, he was promoted to major There were four majors in the regiment In 1809 he had risen to third, in 1810 to second, and in 1811 he became senior major He was promoted to lieutenant-colonel in the army on January 1st, 1812, and in April, 1812, got the same rank in his regiment In 1813 he became senior lieutenant-colonel, and got the command of the regiment when his predecessor, Colonel Stirling, was promoted to major-general and went home, shortly before the battle of Nivelle

Most of Macara's military service was spent in hard fighting in the Peninsula The first battalion of the Black Watch went out to Gibraltar in 1805, thence to Portugal in August, 1808 It served under Sir John Moore in the retreat to Corunna and battle of Corunna on January 16th, 1809 From Corunna it returned to England, and served at Walcheren in August and September, 1809 The second battalion landed at Lisbon in July, 1809, and took part in the battle of Busaco on September 27th, 1810, the defence of the lines of Torres Vedras in the winter of 1810-11, Fuentes d'Onoro on May 3rd, 1811, and in the siege of Ciudad Rodrigo and the capture of that citadel on January 19th, 1812

The first battalion landed at Lisbon on return from England in April, 1812 The two battalions were then combined, and took part in the actions at Salamanca on July 23rd, 1812, Burgos (September 19th, 1812), Vittoria (June 21st, 1813), battle of the Pyrenees (July 25th, 1813), capture of San Sebastian (September, 1813), passage of the Bidassoa (October 7th, 1813), capture of Pampeluna (October 31st, 1813), battles of Nivelle (November 10th, 1813), Nives (December 9th, 1813), Orthez (February 27th, 1814), and Toulouse (April 10th, 1814) In how many of these actions Macara took part cannot be stated with certainty He received a medal for the battle of the Pyrenees, and clasps for Nivelle, Nives, Orthez, and Toulouse, having commanded the regiment in the last four, and also the Peninsular Gold Cross

The Black Watch sailed for Ireland in June, 1814, but were among the troops sent to Belgium to meet Napoleon after his return from Elba The regiment landed at Ostend in the middle of May, 1815 The first general action took place at Quatre Bras on June 16th, 1815, and in that action Macara was killed, commanding one of the best regiments in the British army in the greatest struggle in which that army was ever engaged prior to 1914

On June 16th the command of the Black Watch passed through the hands of four men within a few minutes—Macara killed, Lieut.-Colonel Dick severely wounded, Brevet Major Davidson mortally wounded, and Brevet Major Campbell In the campaign the 42nd lost 4 officers, 2 sergeants, and 45 rank and file killed 19 officers, 12 sergeants, and 216 men wounded—nearly all at Quatre Bras At Waterloo itself, two days later, they lost only 6 killed and 37 wounded These were heavy casualties a century ago, though they sound small enough compared to those incurred during the recent war

The Order of the Bath was reorganized in January, 1815, when all the existing Knights of the Bath (K B) became Grand Crosses (G C B), and two new ranks were instituted —Knight Commander (K C B), and Companion (C B) Macara was one of the first gazetted K C B, on January 2nd, 1815

Macara was an only child and never married, so he left neither descendants nor near relatives A joint monument to him and to Colonel Cameron of the Gordons, who also fell at Quatre Bras, was erected on the hill of Tor Alvie, north of Kingussie, in Inverness-shire

MEDICAL SICKNESS, ANNUITY, AND LIFE ASSURANCE SOCIETY

The annual general meeting of the Medical Sickness, Annuity, and Life Assurance Society was held at the offices of the company, 300, High Holborn, W C, on October 6th, under the chairmanship of Dr F J Allan

Chairman's Address

The Chairman said that the members must have read with much satisfaction the annual report which had been circulated, it showed the society to be in a healthy and flourishing condition The society was in its fortieth year, but its conversion from a friendly society into a mutual insurance company had imparted fresh vigour into it In the sickness and accident branch the additional business was represented by a net increase of £3,550 in annual premiums The sickness and accident claims amounted to £24,131, which, though £5,000 larger than the previous year, was still within the figure expected, the increase was largely attributable to influenza. Notwithstanding regular advertising in the medical press, it was surprising the number of practitioners who were unaware of the society's existence, and had therefore made no provision against the risks of accidents or sickness A short illness meant an increased expenditure in the household, but when the illness was of long duration, or led to permanent incapacity, a medical man's savings—if he had any—might soon be dissipated Letters of thankfulness had been received from many permanently incapacitated members of the society for the regular help afforded them for many years In some cases their insurance benefit had been their sole income The life assurance branch, a comparatively new department, showed satisfactory progress, the new business had increased by leaps and bounds each year Life assurance was the best investment obtainable, since it afforded the professional man an opportunity for providing for his old age, or for his dependents in the event of death, at a relatively small initial outlay The society had introduced a scheme, which was meeting with appreciation, whereby newly registered practitioners might assure at reduced premiums in the earlier years when income was restricted A further advantage not obtainable under any other form of investment was that a rebate of income tax was allowed in respect of the premiums paid Dr Allan emphasized the advantage of insuring in a mutual company like theirs, inasmuch as the funds belonged entirely to the members, who got the benefit of the lower premiums charged, since there were no shareholders to claim any profits that accrued and no agents to claim a commission on every premium There was no doubt as to the stability of the company, the funds were invested only in first class securities The interest yield was not so high as would be the case if the investments were of a more speculative kind, but the board acted on the principle of safety first In conclusion, Dr Allan expressed the board's appreciation of the loyal services of all the staff, and thanked them for their ever willing co-operation He moved that the annual report and balance sheet be received and adopted

The motion, on being put to the meeting, was carried unanimously

Dr Charles Buttar and Dr Harvey Hilliard were, on the motion of Dr W T Evans, seconded by Dr N Walker, re-elected members of the board of directors

Messrs Harber, Sturges, and Fraser were re-elected auditors for the year

A vote of thanks to the chairman, proposed by Sir William Willcox, seconded by Dr W K Sibley, concluded the proceedings.

British Medical Journal.

SATURDAY, OCTOBER 11TH, 1924

CORRELATION OF PRE-CLINICAL AND CLINICAL TRAINING

THE Association of American Medical Colleges held a meeting at Omaha at the end of last February and the *Proceedings* a copy of which reached us a short time ago contain among the twelve papers several dealing more especially with the problems of the relation between the teaching of the pre-clinical and clinical subjects.

Within the recollection of a generation the teaching of anatomy and physiology in this country was mainly though not everywhere in the hands of practising surgeons and physicians and although the whole-time teacher has now come into his own, those who were taught under the old regime must feel inclined to rub their eyes with a Rip van Winkle-ish sensation at a recent American dictum that the really vital problem of the correlation of the medical curriculum would only be solved when the so-called pre-clinical subjects were taught by men in sympathy with clinical medicine and the so-called clinical subjects by men who know enough about pre-clinical sciences to apply them, and that until that time comes attempts at correlation must be continued. As a return to the old plan is most improbable and as the problem is equally important in Great Britain it may be interesting to hear how the question of bridging the gap between the two divisions of the curriculum is being dealt with in the United States.

That the pre-clinical subjects should be somewhat cut down and brought into a relation of practical application to medical practice is no doubt the fervent belief of most clinicians. Both here and in America there is a move to make the professors of physiology and anatomy consultants to the hospitals and at Louisville the professor of anatomy is to be consulting radiologist to the hospital, thus recalling the close association at Manchester of the anatomical department of the University with the x-ray department of the Royal Infirmary, where Dr. A. E. Barclay's assistant, Dr. Woodburn Morison is or was also university lecturer in Professor Stopford's department. On the other hand, it is perhaps less easy to interest clinicians in the pre-clinical subjects: at any rate Professor David L. Edsall of Harvard said that he was much struck in 1923 when inspecting the educational conditions in Great Britain—the dominating country in physiology—by finding that less physiology is taught in the British clinics than in other countries because the teachers are still interested almost solely in pathology in relation to clinical work. After several trials in correlating the two divisions of the curriculum he comes to the conclusion that little can be accomplished by formal separate and self-conscious methods, and that it is wiser quietly to bring this end about by "infiltrating the atmosphere" as indeed had been done in various directions. The teaching of neurology has been combined with that of anatomy for a considerable time in some American medical schools.

In an earnest address describing an experiment in interdepartmental correlation Dr. Donald Joseph Guthrie recognizes the danger to which the hard-worked student is exposed when he comes among the keen specialists of the pre-clinical subjects and has to serve many masters instead of as in the old days of apprenticeship, receiving his instruction from one source. As a preliminary step to connecting the pre-clinical and clinical instruction he would bring the teachers of the respective preliminary studies into closer co-ordination. He suggests possibly not without serious intent that if the physiologist (and no one) and the pathologist attended the lectures of other departments they would be less likely in their own courses to plough a lonely furrow. Although this desperate remedy does not appear to have been put into execution at the University of St. Louis other plans for correlating instruction have during the last eight years been tried for example when the physiologist lectured on the circulation or nervous reflexes the instructor in physical diagnosis or the head of the neurological clinic has come in to show the clinical aspects. But after this and other variations had been tried it became clear that such didactic methods did not call on the student himself to make sufficient effort and that it would advantage him more to delve on his own account. Accordingly three years ago a scheme was inaugurated whereby students working in pairs after preliminary instruction how to dig out for themselves information and references from original publications prepare papers dealing with the anatomical physiological pathological clinical and therapeutical aspects of the various systems. These papers were read before the other students by their authors and criticized by the teachers they were then deposited in the library and the students as a whole were required to abstract and have a knowledge of their contents. This method worked with benefit to both the teachers and the taught.

Dr. O. H. Perry Pepper of Philadelphia records the experiment begun last year in the medical school of the University of Pennsylvania of giving once each week an informal question and answer form of clinic to students in their first year designed to correlate chemistry physiology and anatomy with their practical work thus proving to them the importance of the early subjects and cultivating from the start their clinical sense and a kindly human attitude towards their suffering fellow men. Another advantage is that it may tend to correct the perhaps unconscious influence of the increasing number of teachers in the preliminary subjects who have not taken medical degrees. The clinics were as far as possible arranged to correspond with the subjects concurrently taught in the elementary courses thus the physiology of the nervous system was illustrated by a clinic on the peripheral reflexes and on cerebral lesions such as cerebral haemorrhage and gastric crises or by a clinic on cases of carcinoma with skiagrams. In these cases the instructor must remember that the students have any medical vocabulary and that words may have apparently simple explanations must be carefully explained in the practical experience of the usual hospital history must be omitted. The clinics appealed to the students' curiosity and their teachers have [illegible] professional attitude on the one hand and [illegible] concerned have [illegible] a sort of post-graduate course in the pre-[illegible]

subjects The same scheme was successfully adopted at Emory University, and was expanded by setting each student to write two essays—one strictly scientific, the other biographical, but in both instances a rather startling recommendation is made to the students as to their method of collecting information If the thesis is on the chemistry of the thyroid gland the student is advised to write to Drs Kendall and Charles Mayo for details of their work and life Such a scheme, if widely adopted, would add terror to distinction, and, indeed, such authorities would be in danger of being extinguished by their own distinction

The method of making students work up a subject as if for an original paper is by no means new, for it was in vogue at the Johns Hopkins Hospital for more advanced students in Sir William Osler's day, and though it may be useful for the able few it is so time-consuming that ordinary students would acquire a very patchy knowledge of the vast field of medicine

BOVINE TUBERCULOSIS AND MILK.

IT is of considerable significance to note that while tuberculosis in man has been considerably reduced during the last half-century, this improvement has been largely confined to adults There is little alteration in the mortality rate in children, in whom a large number of the cases are of bovine origin and can consequently be traced to the ingestion of milk from infected cattle The problems presented by the presence of this disease in these animals are therefore of very deep importance in public health Their magnitude may be realized when it is understood that probably upwards of 60 per cent of the milch cattle are tuberculous Gofton[1] points out that nearly £100 weekly is spent in condemnations of tuberculous animals slaughtered for food in the city of Edinburgh alone

Tuberculosis, in bovines as in man, takes many forms, and, apart from the actual demonstration of the bacillus in the lesion or in milk, modern methods of diagnosis consist of various modifications of the tuberculin test The most common method in use is subcutaneous injection A regular rise in temperature to over 103° F within twenty four hours is considered a positive reaction There are many limitations to this test—the most important being a temporary immunity to it caused by a previous inoculation An intradermal test consisting of the injection of small quantities of concentrated tuberculin into the skin is also used This injection is usually made into the subcaudal fold of skin or into the lower eyelid (the so called intrapalpebral test), and a positive reaction is indicated by the appearance of a sensitive swelling at the site of inoculation between the twelfth and seventieth hours after injection The third method used is the ophthalmic test in which a few drops of the tuber-

Toulouse, having commit[illegible] eye, preferably sensitized and also the Peninsular Gold All these tests have their

The Black Watch sailed [illegible]siders that they should were among the troops sent to [illegible]nction with a physical after his return from Elba The [illegible] is obvious that the in the middle of May, 1815 The [illegible] thorized hands At place at Quatre Bras on June 16th, [illegible]erculin, and by its Major was killed, commanding one in the British army in the greatest slender the animal army was ever engaged prior to 1914 a The Ministry

On June 16th the command of the [illegible]ry tuberculin in through the hands of four men within the wisdom of Major killed, Lieut.-Colonel Dick Sc[illegible] Brevet Major Davidson mortally woun[illegible]

this omission is doubtful, but the mere inclusion of veterinary tuberculin would perhaps be of little use unless the sale were also brought under control

The treatment of animals which react to the test presents many problems—economic as well as hygienic Bang, the great Danish investigator, believed that the pasteurization of milk of reacting animals with no 'open" lesions was all that was necessary, and Copenhagen's low child death rate from tuberculosis supports this conclusion He also believed in the conservation of valuable animals for breeding purposes In any case, the eradication or even control of bovine tuberculosis is useless unless conditions in farms and cattle sheds are made hygienic In this respect even more depends on the farmer than on the design and construction of the buildings Even in badly designed and badly built sheds—and the majority fall within this class—good pure milk can be produced if they are kept really clean One of the first steps is the efficient instruction of the farmers in veterinary sanitation Vaccination against the disease has not yet been developed to any great extent, but the recent work of Vallée and his fellow workers in France in this respect is significant These investigators inoculated some young cattle with an almost avirulent strain of the bacillus in a non-absorbable medium and found that a considerable degree of immunity was developed Their experiments, however, are not yet completed

The decreasing mortality from tuberculosis among adults is due to a large number of factors, probably the most important is the increasing attention given to general hygiene and cleanliness Balfour and Scott,[2] however, have recently drawn attention to another possibility Statistical investigations have shown that mild infections with the bovine strain of the bacillus—such as are caused by the ingestion of the organism in milk during childhood—may greatly assist in setting up and in increasing the general resistance of the body Statistics also show that while the adult tuberculosis death rate is declining, the consumption of milk and milk products has been steadily increasing, and the chances of such immunization have become more frequent and probably more constant The truth of Römer's law—that where tuberculosis is rare it is acute and fatal, but where it is common it is chronic and relatively benign—is finding more and more support This raises the interesting question of what would be the state of this country in the course of the next few generations if we eradicated tuberculosis without doing so in the rest of the world We might find ourselves in the same position as those uncivilized lands which have been already devastated by this disease of civilization Balfour and Scott suggest that possibly the Utopian dream of a tubercle-free milk supply—a different matter from the practicable clean milk supply—would not be desirable if we could ensure a regular optimum dose of the bacilli The danger from milk is due less to the presence of the bacillus than to the presence of an excessive number of bacilli If milk is pasteurized at a low temperature, and the process is correctly carried out, it contains only dead pathogenic organisms The whole problem, however, bristles with difficulties, and only in the close co-operation of the medical and veterinary professions, combined with steady and prolonged research, can we hope to see a satisfactory improvement in the struggle against tuberculosis

SIR MALCOLM WATSON

In recognition of the honour of knighthood conferred upon Sir Malcolm Watson, M D , D Sc , on June 3rd, for his services in connexion with the prevention of malaria, Sir Ronald Ross gave a luncheon on October 2nd at the Hotel Bellevue, London Replying to the toast of his health, the guest gave an account of his work in the Federated Malay States An early and serious difficulty was the clay soil which caused a considerable amount of surface water, and in the hill lands the mosquito was able to live and multiply in running water Surface drainage only resulted in improving the conditions for the growth of mosquitos A scheme of subsoil drainage was put in hand in 1910 and in consequence the cases of malaria dropped from 6 185 in 1914 to 10 on July 31st, 1924 To illustrate how protecting them from disease increased the efficiency of the labour forces, Sir Malcolm Watson compared the years 1916 and 1917 with 1914, and calculated that 10 722 working days had been saved This portion of his work related to Klang and Port Swettenham, but subsequently Singapore was taken in hand, with the result that about 35,000 lives had been saved in the last ten years He compared the work in the Malay States with Assam which he had visited in the early part of this year and remarked that little malaria control was effected because of a feeling throughout India that such work was not practicable Although generally there was but little opportunity at present to carry out the drainage requirements yet in one case, in a tea garden over six miles of drains, representing 300,000 cubic feet had been cut with very encouraging results During his stay in India he visited Mian Mir in the Punjab, where an abortive attempt at malaria control had been made in 1902-3 He hoped that the attempt would be made again before long but on improved lines In conclusion, Sir Malcolm Watson paid a warm tribute to the Ross Institute, and declared that through the work of Sir Ronald Ross over 100,000 lives had been saved in the Malay States Among the medical men who attended the luncheon were Sir William Leishman, Sir David Bruce Sir Percy Bassett-Smith Sir William Simpson Sir James Cantlie, Dr Andrew Balfour, and Dr Aldo Castellani

FAR EASTERN ASSOCIATION OF TPOPICAL MEDICINE.

The fifth congress of the Far Eastern Association of Tropical Medicine, held at Singapore in September, 1923 under the presidency of the Hon Dr A L Hoops, was reported briefly in our issue of November 17th (p 940), and in more detail in that of December 1st, 1923 (p 1059) The association was founded at Manila in 1908, where the first congress was held in the following year The second congress was held at Hong-Kong in 1912, and the third at Saigon in 1913 After the lapse of eight years due to the war, the fourth congress was held in 1921 at Weltevreden in Java Last year's congress at Singapore was of exceptional interest and value, it owed much of its success to the active co-operation of the Malaya Branch of the British Medical Association, whose honorary secretary, Dr J W Scharff, acted as secretary and treasurer of the congress The full transactions of the congress have now been published in a handsome volume with many excellent illustrations [1] In a brief preface the editors—Drs A L Hoops and J W Scharff—express thanks to their colleagues in Singapore, and to members of the staff of the London School of Tropical Medicine, for assistance in its preparation The opening pages of the volume give full information regarding the constitution and membership of the association The text of the address of welcome to the congress by Sir Laurence Guillemard, Governor of the Straits Settlements and High Commissioner for Malaya, is followed by Dr Hoops's presidential address on the prevention of disease in the tropics Sir Malcolm Watson's opening address on malaria introduces a group of papers on malaria and allied topics by various members of the congress The sections that follow consist in like manner of grouped papers on beri-beri ankylostomiasis plague, and leprosy The succeeding 500 pages contain the text of thirty-five papers on miscellaneous subjects and brief reports of such discussions as followed them In the nature of things most of these communications deal with tropical diseases but many also are of general interest The volume ends with a summary of the business transacted during the congress together with an outline of the scientific meetings and some account of the social functions This volume of *Transactions* reflects great credit on the editors whose acquaintance many members of the British Medical Association had the pleasure of making during the Annual Meeting at Bradford last summer

Edited by the Hon A L Hoops M D President and J W Scharff M B Honorary Secretary of the Congress London John Bale Sons & Danielsson Ltd 1924 (Crown 8vo pp xx + 957 coloured and numerous charts in text 30s net)

SCIENTIFIC AND INDUSTRIAL PESEAPCH

The report of the Committee of the Privy Council for Scientific and Industrial Research for 1923-24 [1] opens with a note that the estimated expenditure for research work and administrative services for 1924-25 amounts to £328 281 as compared with £270 863 in 1923-24, and £297,437 in 1922-23 Great progress has been made in organizing active intellectual co-operation in scientific matters between different State departments, and it is felt that the time is coming when the Government Survey will have at its disposal a scientific personnel competent to recognize the scientific significance of practical difficulties and the facilities existing to deal with them and whose standing will command acceptance by the scientific heads of the various department and establishments Grants have been made to research associations for some time and during the past year full reviews have been held of nine associations which have existed for about five years In all cases except that of the British Scientific Instruments Research Association further grants are being given on a rapidly decreasing scale The opinion is expressed that research associations should realize that they must sooner or later look for sole maintenance to the industries they represent The British Scientific Instruments Research Association has accepted an offer of further grants of £10 000 a year for five years on condition that the industry subscribes annual sums rising from £1 500 in the first year to £2 250 in the fifth The particular circumstances of this industry called for exceptional treatment, because the advance of science is largely dependent upon the continued improvement of scientific instruments and because the work of this association is an important supplement to the research undertaken in the interests of national defence Suitable conditions for close control over the operations of the association have been framed and accepted In connexion with the Fuel Research Board proposals are put forward which include the more rapid development of the chemical and physical survey of coal seams During the year 291 grants were made to individual research workers and 1 in training a compared with 30+ in the previous year The standard of the students' work has improved appreciably a warning note is sounded, however that great importance is to be attached to the school history of individuals and the experience has shown that it is inadvisable to allow [illegible] to absorb whole of the student's attention during the last two years of school life to the exclusion of the humanities and the detriment of his general education A summary of the

work of the research organizations of the department includes reports of the good progress made during the year at the National Physical Laboratory The most important event of the year, so far as the Food Investigation Board was concerned, was the sending of the small scientific expedition to Australia to study the conditions of apple transport The report on this subject was reviewed in our columns on August 25th, 1923 (p 335), and a special report on the bacteriology of canned meat and fish on January 19th, 1924 (p 127) Investigation of the changes brought about in beef, mutton, and fish by freezing was continued during the year It was found that in muscle tissues which has been slowly frozen, fluid separates containing proteins, ferments, and other organic substances in solution This liquid drips away from the flesh on thawing, whereas when the flesh has been frozen rapidly in air the course of chemical changes is strikingly different Trials were made with ice containing a disinfectant in low concentration, the results obtained were not very satisfactory, the flesh becoming impregnated with the disinfectant A Dental Investigation Committee was appointed during the year to initiate and supervise researches from the chemical and metallurgical points of view Work has been begun on the various alloy systems involved in the production of dental amalgams, this investigation is being carried out at the National Physical Laboratory Arrangements have also been made for research into vulcanizable rubber and into substitute materials for dentures and adhesive lutes An investigation by the Fabrics Co-ordinating Research Committee upon the action of fireproofing agents has been started at the Royal Aircraft Establishment Information relating to methods of waterproofing has been collected, but it was felt that no useful conclusion could be reached until more was known about the physiological effects of wearing garments made from the various types of proofed material the Medical Research Council has accordingly arranged for a series of experiments on this subject Developments in the organization of research in other parts of the empire are described in an appendix

THE OPIUM EVIL

FROM discussions in the press and information received from Geneva, it appears that the preparation of the agenda for the two conferences to be held next month with a view to carrying out more effectually the articles of the Opium Convention of 1912 exhibited some divergence of view among the members and assessors of the Advisory Committee on the opium traffic The reversion of China, which in 1914 was reported to be free from cultivation of the poppy, to being one of the chief, if not the largest, opium-producing countries in the world gave much cause for anxiety Persia, again, appears either to be lacking in the will or the power to carry out the provisions of the Hague Convention The Indian Government is criticized for continuing to export large quantities of opium to the Straits Settlements, Borneo, and Hong-Kong, well knowing it is to be used for smoking purposes, which the Indian Government has officially stigmatized as 'a social vice" It would appear to be argued in some quarters that if there is a demand for smoking (or prepared) opium in the Far East, and if other countries, such as China and Persia, pander to that taste, it is both justifiable and good business for the Indian Government to do likewise The findings of the Royal Commission of 1895 are cited as unchallenged, although Lord Morley, when Secretary of State for India, dismissed them as having "failed to satisfy public opinion in this country or to ease the consciences of those who had taken the matter up" The House of Commons twice affirmed its conviction that the Indo-Chinese opium trade was "morally indefensible" That trade is no more, but China has gone back on her undertaking to extinguish opium production within her borders, and is now raising thousands of tons of opium every year When the Opium Convention was signed at the Hague in 1912 the British plenipotentiaries were instructed to declare that its provisions "shall apply to British India in every respect in the same way as they shall apply to the United Kingdom" It may be legitimately questioned whether the export of thousands of chests of opium by the Indian Government for smoking, or their retail of opium for eating to the native population of India, can be regarded as faithful observance of that official declaration The Union of South Africa has redirected attention to the abuse of Indian hemp, and the question of its inclusion as a dangerous drug to which the Convention should apply is to be considered The slow progress made in putting into effective practice a Convention now twelve years old is no doubt disquieting As those who drafted that document indicated at the time, control of these dangerous drugs at and from the source is the primary object to be aimed at, and so long as countries which produce the opium poppy and the coca shrub either lack the will or the power to arrest a lucrative trade, or are not prepared to co-operate internationally in suppressing the abuse of these narcotics, little progress will be achieved by the multiplication of conferences and committees

THE PROTECTION OF EYESIGHT IN INDUSTRY

CORRECT methods of industrial lighting are necessarily based on consideration of the comfort of the eye Hence the complete solution of this complex and interesting problem demands the concerted effort of the physicist and the physiologist, supplemented by the practical experience of the workshop In a report on the problems of industrial lighting[1] issued recently by the International Labour Office (Geneva) it is sought to bring the facts ascertained through these three sources of inquiry into close relation, and a very large measure of success has been attained The problem is complicated by individual, social, and physical conditions, and any regulations promulgated may be rendered difficult of application by local circumstances which cannot readily be modified Thus, in the case of natural lighting, climate, the aspect of buildings, narrow passages, badly lighted courtyards—all have an important influence Yet in each of these fields for reform progress has been made Research on suitable daylight illumination has been successfully applied to the planning of school premises, and from these experiences it is possible to proceed to the more complicated problem of factory and workshop lighting In artificial lighting the problem is still more complicated, for inquiry has to be made into the spectra of the various sources of light, the constancy of the light, the heat produced by it, the products of combustion, the influence of ultra-violet rays, and the influence of all these elements on the eye There is much work to be done, but real advances in knowledge have been made, as is shown by the collated reports The increasing demands of industrial life demand more and yet more light So far this has been met by the increase in the specific intensity of the illuminant and the extended use of the gas filled electric glow lamp, this has brought with it special difficulties, and research is needed to secure that the injurious effects of these new illuminants shall be converted into advantage Efforts are being made to render the illuminant as uniform as possible through the working areas of shops, and to avoid as far as possible the dazzling effect on the eye of imperfectly screened sources of great brilliance For this purpose the conversion of direct light into diffused light

[1] *The Protection of Eyesight in Industry* International Labour Office Studies and Reports, Series F (Industrial Hygiene), No 6 Geneva 1923 Pp 158 Price 2s 6d.

by various methods of screening is of importance There is also no doubt that industrial organizers are beginning to realize the value and the economy of new methods—work is better done, the workers are happier in their work, their health is safeguarded, and accidents are less frequent There is now an agreed unit of light, which curiously enough, is exactly equal to the British unit candle power—derived from the Harcourt petance lamp and in current use for over twenty five years The qualities of daylight have been investigated, and the value of it in the several seasons of the year set out The immense difference between summer and winter is shown by graphs, and the necessity of reinforcement of winter light by artificial means enforced The desiderata of artificial light are said to be that it should be easy to use and not too expensive and should resemble daylight as closely as possible in regard to immobility constancy of intensity, absence of variation in the illumination, and spectrum, so as not to cause fatigue or injury to the eyes If fine work is to be done the spectrum of the artificial light should be as near as possible that of the sun—which is essentially a diffused light—and should not alter the colour of objects It should not be rich in ultra-violet rays, its brightness should be moderate and its radiant surface sufficient it should not sensibly raise the temperature especially in the neighbourhood of the worker's head and it should not alter the composition of the air by products of combustion Careful tests have shown that dirty and dusty fitments cause a heavy loss as do dirty windows The influence of reflectors for various purposes has been carefully worked out so that there is no longer any excuse for using shades designed for one type of lamp for another type The type of lighting and standard of illumination must be adapted to the work This is shown by the experimental determination of the amount of reflection obtained with work on different soft goods It is lowest with black velvet, being only 0 37 per cent it increases through the dark serges reaches 10 9 with natural wool and attains a maximum of 65 9 per cent with white cloth Other sections of the report deal with visual acuity and occupational acuity of the eye with eye strain and the influence of posture and errors of refraction and the effect of the various rays of the entire spectrum on the eyes In one of the appendices is a table of suitable occupations for men and women according to the indications given by their visual acuity The section on industrial accidents shows how heavy is their incidence among night workers and in the winter months certain social insurance experts have stated that 25 per cent of the total number of accidents are connected with insufficient lighting, but no thorough inquiry on this point has ever been carried out There is a good bibliography The book has been translated from the French of the original edition by Mr Leon Gaster, honorary secretary of the Illuminating Engineering Society of London, who has done his work well

SUPPLY OF MORPHINE AND HEROIN TO DRUG ADDICTS

THE Minister of Health has appointed a committee of nine medical men to advise him in regard to the supply of morphine and heroin (diamorphine hydrochloride) to persons addicted to these drugs The chairman of the committee is Sir Humphry D Rolleston, Bt K C B M D President of the Royal College of Physicians of London and the other members are Sir William H Willcox, K C I E C B C M G M D (Honorary Medical Adviser to the Home Office) Dr J W Bone (representing the British Medical Association) Dr R W Branthwaite C B (Board of Control), Dr G M Cullen (Scottish Board of Health) Professor W E Dixon, M D, F R S (Reader in Pharmacology, Cambridge University), Dr John Fawcett (Physician to Guy's Hospital), Dr Adam Fulton (Divisional Medical Officer, Ministry of Health), and Dr J [illegible] Whitaker (Senior Medical Officer, Ministry of Health) The terms of reference to the committee are To consider and advise as to the circumstances, if any in which the supply of morphine and heroin (including preparations containing morphine and heroin) to persons suffering from addiction to those drugs may be regarded as medically advisable, and as to the precautions which it is desirable that medical practitioners administering or prescribing morphine or heroin should adopt for the avoidance of abuse and to suggest any administrative measures that seem expedient for securing observance of such precautions" The joint secretaries of the committee are D F W Adams, O B E, and Mr R H Crooke Ministry of Health Whitehall, S W 1 to whom all communications should be addressed

AT THE CHURCH CONGRESS

THAT much troubled and very troublesome lady Joanna Southcott whose followers at the Church Congress here at Plymouth were heaping maledictions on the heads of the bishops because the bishops would not take her cult with sufficient seriousness reappeared in the spirit last week at Oxford in a more pacific mood The streets were invaded by numerous sandwichmen who carried placards declaring, in startling red letters a Great discovery by the Panacea Society of the healing of diseases through Joanna Southcott That is about all that can be got on a placard, and for further particulars the curious were referred to smaller bills which were pressed by ardent ladies into the hands of those attending the twenty meetings of the Congress These bills only made the mystery a little deeper They spoke of slow but sure deliverance not miraculous but by treatment without money and without the price or accepting any particular belief from cancer nerves consumption epilepsy paralysis rheumatism eye and ear trouble etc etc etc It was added Do not write for particulars but state all your complaints at once in as few words as possible and an address was given To see such proclamations along the academic highways of Oxford certainly gives rise to some curious reflections The Church Congress, of course is in no way responsible for what goes on at its doors and on its platform on this occasion faith healing and its associated subjects were mentioned only to be dismissed One of the readers of papers the Rev L W Grensted fellow and chaplain of University College, Oxford said that dubious relics miracle mongering hysterical healing ministers not to worship but to superstition On the other hand Miss Smithell licensed woman missioner in the diocese of Chichester strongly urged the ministry of healing which she said must not be limited to praying for the sick but must take the sacramental form of the laying on hands which became in the faithful act not of our hands but the pierced hands of Him who was wounded that men might be healed She begged the responsible for the training of the future ministry to affirm that the ministers of Christ were called to heal just as much as to preach and as one who herself had taken part in healing missions she said that there was no thing like healing for uniting Christians together and for bringing nearer the advent of the Kingdom One also rejoiced in reading paper the remark of Lady Maud Warrender in a [illegible] that clergymen should not restrict their text to [illegible] but should seek comforting and strengthening words [illegible] other literature that the phrases of M Coue had a certain religious significance and a germ quality which might [illegible] turn in a basis for pulpit discourses A subject which [illegible] drawn fire at previous Congresses—has or birth control—was touched upon only by one speaker the Bishop Woolwich, and by him in terms of emphatic commendation on

He said that the use of artificial contrivances to prevent conception, such as was advocated by what was euphemistically called the "birth control" school, was clearly opposed to Christian conduct The purpose of such contrivances, he declared, was to make possible the exercise of a spiritual faculty for the satisfaction of a physical desire only, and to prevent the spiritual consequence for which the faculty was given Such a practice was the degradation of a sacrament It was due to a perverted human ingenuity, it was fraught with great dangers, physical and moral, and it was a practice on which it was impossible to invoke the blessing of God because it was entirely subversive of the spiritual significance of His sacramental gift

THE PREVENTION OF BLINDNESS IN INDIA

DISEASES of the eye are much more prevalent in Asia than in any other part of the world The teeming populations of the great plains of India and China, their lack of knowledge of personal hygiene, and the climatic conditions, favour the spread of contagious eye diseases, with resultant scarred eyes, and partial, and not infrequently complete, blindness The prevailing undernourishment of many of the races of India, combined with the stress of long hours of intense sunlight, bring about atrophic changes in the crystalline lens of the eye, with consequent blindness from cataract Similar conditions are to be found in miniature in Egypt along the Nile valley, and since the latter country is the more visited by Europeans the bad eye conditions are patent to all, and have called for attention early The munificence of Sir Ernest Cassel has provided for the establishment of central, local, and travelling hospitals, with a competent medical staff, and the effects, both in the prevention of disease and the relief of suffering, have been great even in these few years The vastness of India makes the problem insuperable to individual effort, or even as a matter of special central organization But much may be done by the teaching and spread of simple rules of hygiene through the schools and village organizations, and the provision of facilities for visits to hospitals We have received a letter signed by Sir Arthur Lawley, formerly governor of Madras, by Lord Carmichael, formerly governor of Madras and of Bombay, and by Lady Pearson, calling attention to the work on these lines now being done by the Bombay Blind Relief Association It has dispensaries and medical officers in four or five districts, and a system of first-aid workers who visit the villages to find operable cases of cataract and furnish simple treatment for sore eyes It is proposed to form a committee in England to forward this work, and communications may be addressed to Dr T Cochrane, World Dominion Press, 3, Tudor Street, London, E C 4

THE first social evening of the session will be held by the Royal Society of Medicine on Thursday, October 16th, at 1, Wimpole Street Fellows, members of sections, and their friends will be received by the President, Sir StClair Thomson, at 8 30 p m Dr W T Grenfell, C M G (Labrador), will give a brief discourse on "Medicine in a Corner of the Empire" (with lantern illustrations) at 9 30 The library will be open, and various objects of interest will be exhibited Music, light refreshments, and cigarettes will be provided Fellows who know of Dominion and foreign practitioners visiting this country are asked to send their names and addresses to the secretary in order that invitations may be sent to them

A SERIES of museum demonstrations on anatomy and malformation of the heart will be given in the theatre of the Royal College of Surgeons of England, Lincoln's Inn Fields, W C, by Sir Arthur Keith, F R S on Fridays, October 17th, 24th and 31st, at 5 p m

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT]

Reassembly of Parliament

PARLIAMENT reassembled on September 30th Despite the arrangement made before the Recess, whereby no business beyond the Irish Free State (Confirmation of Agreement) Bill should be taken till October 28th, controversy soon developed on other subjects, and this week began at St Stephen's with strong expectations of an early dissolution and general election

Sir George Newman's Report

On October 2nd Mr Wheatley, the Minister of Health answered questions by Labour members on the annual report of Sir George Newman for 1923 In reply to Mr J Guest, Mr Wheatley said he had read Sir George Newman's statement in that report that many health authorities and medical officers of health muddled on from hand to mouth, the victims of every passing whim or popular stunt, instead of organizing their work as responsible and competent men charged with the duty of directing the public service of their district Mr Wheatley said there was no question that the large authorities were, as a whole discharging their duties satisfactorily The difficulty was largely due to the passivity of local public opinion on health questions in many areas, and he had this point under consideration Further difficulty arose from the number and size of many of the 1,800 sanitary authorities a subject which would fall within the terms of reference to the Royal Commission on Local Government now sitting

Mr Guest asked if there were a record at the Ministry of Health of "muddling" authorities and "incompetent" medical officers of health Mr Wheatley replied that there was

Mr Guest further asked what steps Mr Wheatley proposed to take, in the interests of the community, to remove such medical officers and to supersede such authorities Mr Wheatley referred Mr Guest to an answer given to Sir Herbert Nield on February 15th This answer was a statement of the classes of medical officers of health and senior or chief sanitary inspectors whose appointments cannot be terminated without the consent of the Minister of Health

Mr Greenwood, Parliamentary Secretary to the Ministry of Health, informed Mr R Richardson that Sir George Newman's statement in the annual report for 1923, to the effect that in hundreds of sanitary districts there was a failure to use the facilities which the sanitary law provided was based upon official records of the Ministry of Health Mr Richardson asked whether Mr Wheatley was prepared to appoint a Royal Commission to inquire into the whole question of the laws relating to public health and housing and into the generally unsatisfactory conditions prevailing in the health service Mr Greenwood said the matters would appear to fall within the terms of reference to the Royal Commission on Local Government now sitting

London University—Answering questions from Mr Gilbert Mr Edward Wood, on October 2nd, Mr Trevelyan, Minister of Education, said he had already announced his intention of setting up a new Departmental Committee to report on the steps to be taken to given effect to the report of the Haldane Commission on London University He could not say when the report of the Committee was to be expected A previous Departmental Committee had made a first report in April, 1914, but had not resumed its work since the war

Death Certificates—On October 2nd Mr T G Penny asked the Home Secretary whether, in the new form of death certificate to be issued, he would make it compulsory for doctors to inspect the body of the deceased before signing, so as to guard, as far as possible, against the chance of live burial Mr A Greenwood, Parliamentary Secretary to the Ministry of Health, replied that no powers were available which would enable such an obligation to be imposed upon medical practitioners, and legislation would be necessary to give effect to the suggestion Mr Penny asked whether the Government if it remained in office, would take steps to bring in legislation to secure these safeguards No answer was returned

Sterilization of the Unfit—Probably for the first time in the House of Commons the Government was asked on October 2nd to investigate the advantages of sterilization of the unfit The subject was raised by Mr Black, who asked whether, in view of the continuously enlarging financial responsibilities accepted by the State with regard to unemployment, invalidity, and old age, he would state the policy of the Government with respect to the procreation of children who, owing to physical or mental deficiencies, became a charge upon the State funds, and whether he was prepared to appoint a Royal Commission to investigate the possibilities of improving the calibre of the nation by restricting the procreation of children to persons possessing a recognized minimum standard of physical and mental efficiency Mr Greenwood replied that the Minister of Health did not see his way to recommend the appointment of a Royal Commission on the question In refusing the suggested Royal Commission Mr Greenwood added that the Minister of Health was not aware of the existence of any recognized standards of physical and mental efficiency

Opening of the Medical Schools.

ST GEORGE'S HOSPITAL

ADDRESS BY SIR ISAMBARD OWEN ON "LOOKING BACK AND LOOKING FORWARD"

At the reassembling of St George's Hospital Medical School on October 1st the inaugural address was delivered and the prizes distributed by Sir Isambard Owen M.D., F.R.C.P., consulting physician to the hospital, who reviewed the medical changes which had taken place during the last half-century and spoke of possible future developments.

Sir Isambard Owen said that from a study of the origin and development of universities in Europe, one of the impressions left on his mind was that the reputation and success of an academic institution was largely proportional to the degree in which it succeeded in creating a sense of corporate existence among its members and a corresponding corporate pride, involving not only a feeling of fraternity but a sense of common interest in the credit and reputation of the community as a whole. He regretted that so little attention had been given to this subject when the reconstruction of the University of London was undertaken at the close of the last century. It was, indeed, the keynote of the counter-scheme which Sir James Kingston Fowler and he put forward at that time. In speaking of the University he could not forbear making an allusion to the great loss which the University had sustained in the death of its member of Parliament Sir Sydney Russell-Wells, who was a distinguished St George's man.

Medical changes during the last half-century (Sir Isambard continued) had been revolutionary. When he himself entered upon medical study fifty-five years ago the teaching of Lister was only just beginning to be followed in England, and at least 95 per cent. of modern surgery was unborn. Ovariotomy was a strictly tabooed subject, cerebral surgery was undreamed of, and the suggestion by a surgeon that as a possible expedient a damaged kidney should be removed was regarded as a professional joke. Preventive medicine was in its earliest infancy, pathology still dealt with dead material alone, and no human ova had then been seen a pathological bacillus. The methods of medical education had undergone no less radical changes for in those days the schools of the London hospitals had only recently completed their organization by absorbing or replacing the private schools of anatomy and chemistry that had previously worked in connexion with them. St George's had since made itself the pioneer in a further advance, in that it had decided to confine itself to its legitimate fields of pathology, public health, and clinical medicine and surgery. Nothing was more striking than the degree to which laboratory methods had supplemented or even supplanted the older methods of clinical investigation. Some appeared to look forward to a day when the whole conduct of clinical medicine would pass into the hands of the wizards of the laboratory, and the physician would appear only as their expectant client. But it was well to remember that clinical observations in the older sense of the term (provided they were accurately made) and also the conclusions drawn from them (if logically drawn) were every whit as scientific as the work of the chemist and the pathologist.

One branch of medical research had somewhat lagged behind the rest—namely, therapeutics. In saying this he was not questioning the value of the light that pharmacology had thrown on the mode of action of remedies or ignoring the many recent discoveries of new and promising medicinal agents. Our forefathers admitted a certain *vis medicatrix naturae* in theory, but ignored it in practice. That manner of regarding therapeutics still prevailed among the public, and was, in fact, the basis on which the whole fabric of quackery was built. It was however when the practical application of the principles of therapeutic science began that the difficulties surrounding it presented themselves. One could hardly wonder, considering all things, that so little had hitherto been accomplished in that direction, and that practical therapeutics was still so largely at the mercy of uncertain conflicting or even mutually contradictory individual views. Small wonder, too, that the establishment of a real science of therapeutics based on exact statistical method had been often pronounced an impossibility. Was this really the case? The three hardest-worked years of his life at St George's had convinced him at least that there was no impossibility in the matter, granted three conditions: a sufficient wide field of inquiry, unity of aim and method among its cultivators, and adequate means to retain the services of fully trained observers, working under a single direction.

With the growth of the scientific spirit another new spirit had entered the medical world—the spirit of co-operation in scientific research. In the growth of that spirit, perhaps, one might look for the future hope of therapeutic science and anticipate that what was deemed Utopian in 1880 might become an admitted possibility of a more modern time. Should such a thing come to pass he hoped that it might be the fortune of St George's Hospital to furnish the starting point of the new advance.

MIDDLESEX HOSPITAL

ADDRESS BY DR CHARLES PORTER ON PREVENTIVE ASPECTS OF MEDICINE

THE opening of the ninetieth winter session of the Middlesex Hospital Medical School took place in the Queen's Hall on October 1st when Mr. S. G. Asher, chairman of the school council presided, and the Earl of Birkenhead distributed the prizes. An address was delivered by Dr. Charles Porter, medical officer of health for Marylebone, who took for his subject, "Some preventive aspects of medicine."

Dr. Porter confessed at the outset that he had a fear that once the medical student got into the wards and began to traffic with disease, to see it and study it, and the multitudinous methods adopted with a view to alleviating it, he might come to regard it as inevitable. It was easy to come to such a conclusion the system of medical education now in vogue almost drove the student to it. He saw so much of disease and the various conditions were so beautifully catalogued for him that it was no to be wondered at if he came to regard diseases and disease groups as established things. Curative medicine he could see at work and its result. Was preventive medicine anything more than a conception? If so, then the out-patient department always thronged the ward always full. This was a reasonable and pertinent question. The student had reason for his doubts.

The lecturer went on to explain that if there were no very obvious signs of the operation of preventive medicine it was because such medicine was very much of the kind that what had hitherto been done was little more than clearing the ground though even in these primitive efforts it was possible to show results which were almost complete disappearance of certain diseases, both infectious mortality of others. The general death rate in England and Wales 1875-80 was 21·4 per thousand; for 1923 it was 11·6. The speaker gave further figures for London and Glasgow showing the same improvement, often even more striking, during the forty years and also touched on the striking results in reducing among infants.

He next reminded the students that the title of "doctor" which they hoped presently to gain gave them the right and the ability to teach In particular, every practitioner who accepted service under the Insurance Acts undertook thereby to carry out preventive as well as other duties He became, as Sir George Newman had said, a "missionary of health," able and privileged to advise the people on the healthy ordering of the home, the formation of personal habit, and the choice of occupation If the doctors and the people would realize their responsibilities and co-operate for prevention, prevention would follow, and remarkable results, if not as wonderful as those already obtained in respect to infant mortality, would be forthcoming He begged the students not to confine their energy and enthusiasm to the study of disease There was much to be gathered from the study of health A professor of preventive medicine had caused amusement by suggesting that, well or ill, everybody should undergo a complete medical examination at regular intervals, and by the age of 60 should have been completely overhauled seventy-five times The reason for the amusement was not clear The speaker believed that the benefit of regular and frequent medical inspection would soon be widely recognized Already, in fact, large numbers of children, leaving the elementary schools, had received there and at the child welfare centres previously a certain proportion of the seventy-five medical examinations due to them The unfortunate thing was that these inspections ceased on leaving school The evidence as to the benefit of these inspections was abundant, but they should not be limited to any age or class

The Earl of Birkenhead, in presenting the prizes, said that he had been particularly struck by the advice that the man of 60 should have been completely overhauled seventy times He himself was not yet 60, and as he could recall only two occasions on which he had been overhauled, it appeared that in the course of the next twelve months he ought to be examined about fifty times in order to get himself on the good books of the professor whom Dr Porter had quoted Lord Birkenhead went on to express his admiration of the work done by the ancient hospital and its school When an institution had for so long a period of time maintained honourable traditions, inculcated a feeling of *esprit de corps*, and maintained a high standard of professional efficiency, the community as a whole owed to it no small measure of gratitude By the continuous opportunity given to young medical men, and to their elders in the profession also, by multiplying the data upon which generalizations could be made, and from which conclusions could be wrested, hospitals were rendering great scientific service It must be a proud moment for young men when they were first saluted by the title "doctor," but he suspected that they did not take long to realize the wisdom of the teaching of Socrates that no man began to be wise until he realized how little he had mastered of the immense sum total of attainable human knowledge He wished to add how sincere was the admiration of laymen for the work done at such a hospital and for the continuing conquests of medical science

A vote of thanks to Dr Porter was carried, on the motion of Dr R A Young, seconded by Professor W B Tuck, and to the Earl of Birkenhead, on the motion of the Chairman (Mr Asher), seconded by Mr John Murray

The Dean (Mr Alfred Webb-Johnson) mentioned in his report the endowment of the University Professorship of Anatomy by the munificent gift of £10,000 from Mr S A Courtauld Mr Courtauld's gift was yet another evidence of the growing realization of the importance of medical education and research He announced with regret the resignation of Professor Lazarus-Barlow, University Professor of Experimental Pathology, and of Dr Campbell Thomson, physician to the department for diseases of the nervous system Among the notable achievements of the year he mentioned the work of Dr E C Dodds on the preparation of insulin, this work, which had resulted in great improvements in the process of manufacture, was due, under Dr Dodds's direction, to the close collaboration between the physicians of the hospital and the departments of pathology, physiology, and biochemistry

WESTMINSTER HOSPITAL

ADDRESS BY MR H J WARING
ON
THE MEDICAL MAN OF THE FUTURE

The introductory address to the students of Westminster Hospital was given on October 2nd by Mr H J Waring M S, F R C S Mr A E W Marshall, a governor of the hospital, presided

Mr Waring said that the science of medicine was still in its youth, and the probable manner and direction of its growth was a matter which should have a great interest for those engaged in every kind of medical practice, and perhaps still more for those concerned with medical education Whether he was right or wrong in his judgement as to the manner in which that growth would manifest itself, there was no harm—probably some good—in letting the mind play with the subject In any case it was necessary to maintain towards the possible future developments a certain alertness and suppleness of mind The trend of development might be viewed with criticism and dissent, but there was no room for apathy or indifference

Two processes were at work in medical investigation and treatment—processes distinct, although in some respects related The first was the process of specialization The increase of specialists was to a great extent an inevitable and, up to a point, a desirable process It was the specialist who could most readily extend the frontiers of knowledge Nevertheless, the process had its dangers, one of which was that the specialist tended to work in isolation and to concentrate his activities on the one particular branch he had made his own Unless the specialist could work in direct relationship with members of his profession engaged on other lines this habit of concentration might take the undesirable form of an obsession, so that every problem came to be viewed by him from a particular angle without regard for other aspects Moreover, specialization had its repercussions in medical education, and in that connexion those concerned with medical education were constantly being met with new demands and new problems Specialists, naturally, pressed for the inclusion or recognition of particular subjects in the curriculum, and yet, under present conditions, there was not time for many such inclusions

The second outstanding feature in modern medicine was the recognition of fresh curative and ameliorative agencies and their continual extension That sweet simplicity which held that to pour down the throat the contents of a bottle was the best, or in some cases the only, method of effecting a cure had become a thing of the past Gradually all the sciences were being directed to this great task of curing or relieving suffering humanity, but the full significance of all this had yet to be appreciated It was this recognition of new agencies and extension of old ones which would revolutionize the practice of medicine and surgery, and it had this much in common with specialization that it made an increasing demand, though of a different kind, upon the time and work of medical students It was no longer a question of a particular method of treatment or an acquaintance with some particular branch of disease, it was a question of the interpretation of the human body in terms of physics and chemistry This opened up the necessity of emphasizing more strongly than ever the importance of the so-called preliminary or fundamental sciences in medical education He sympathized with a certain amount of impatience on the part of medical students in their desire to get more quickly to grips with the actual practice of medicine, nevertheless, he was convinced that the medical student of the future would have to spend more time rather than less upon the fundamental sciences In the future the value of his work in the wards would be more directly determined by the attention given to the preliminary and fundamental sciences before admission to the wards

What would be the cumulative effect of this increase of specialization on the one hand and of the constantly increasing employment of new diagnostic and curative agencies on the other? He paused to think of its bearing

on the future of the hospitals The recognition of the value of the resources of a modern hospital from this point of view was not confined to medical men, the lay public had become aware of it, and instead of reluctance—a survival from pre Listerian days—the upper and middle classes were showing almost eagerness for hospital treatment in illness The provision of adequate accommodation for paying patients was now one of the problems confronting the governing bodies both in London and the provinces Was it reasonable to expect any medical practitioner, however learned, to be able to give in a complicated case anything more than a general diagnosis and then to refer the patient to the appropriate expert or group of experts For his own part he envisaged an organization of the medical profession in which there would be brought to bear upon a particular case all the resources for diagnosis and treatment which were at the disposal of a great hospital Some such co-operation and assistance there was already, but it was very often circuitous and indirect

The length of the course in the medical school of the future would probably be much the same as at present but its character would be different in certain important respects With the raising of the standard of science teaching in public and secondary schools the medical student would enter on his work with a grounding in physics chemistry, and biology Physiology would probably be more comprehensive than at present, and would include a fair amount of biochemistry and biophysics Physics would be carried much higher, and so shaped as to have a definite bearing on subsequent clinical work He would expect more emphasis to be laid on pathology On the other hand, the study of materia medica was at present far too detailed and extensive Altogether, the ideal would be to give the student the best possible training in general medicine, allowing specialization only in those subjects to which he intended to devote himself in practice

As for the organization of medical practice Mr Waring thought that in urban areas the medical man practising alone would gradually make way for a group, partnership, or association, organized on the basis of division of labour, with certain lines of specialization which however, would not be so marked as to divide the group into watertight compartments One of the group would certainly be a pathologist Associated with the group would be an institution for the reception of patients, linked up with other institutions of a similar nature It was fairly obvious that some radical alteration in national health insurance administration must follow, and for his part he would not be sorry He was convinced that under a group system such as he had outlined it would be possible to hand over to the profession responsibility for the health of the people He closed with a word or two about the Navy, Army, and Air Forces He thought that, in future, arrangements must be made whereby a considerable proportion of the civil medical profession would always be available for immediate service with these forces and would occupy a proper, not a subordinate or inferior, position

ST BARTHOLOMEW'S HOSPITAL

OLD STUDENTS' DINNER

At St Bartholomew's Hospital the opening of the new winter session was as usual marked by no introductory address or other formal celebration, but the annual old students' dinner was held on the evening of October 1st in the Great Hall of the hospital St Bartholomew's is fortunate in possessing this fine chamber where the medical officers and lecturers and past students can dine together once a year within the hospital precincts The chair was taken by Dr J H Drysdale, who has lately resigned the post of physician to the hospital His immediate supporters at the high table included Sir Clifford Allbutt, Regius Professor of Physic at Cambridge Sir Archibald Garrod Regius Professor of Medicine at Oxford, and Sir Anthony Bowlby, Sir William Lawrence and Sir Herbert Cohen, almoners of the hospital, the masters of several City companies, and the senior members of the active medical and surgical staffs In proposing continued prosperity to St Bartholomew's Hospital and Medical College, the Chairman referred to some of the most pressing needs of the hospital, mentioning in particular the construction of new operating theatres and of small ward laboratories He said that new buildings in Giltspur Street have been acquired for the accommodation of the physiology laboratories to the great advantage of that and other departments of the school There are now 800 students working at St Bartholomew's of whom 100 have entered this session for the full curriculum, in the past year 123 students obtained the English conjoint qualifications In congratulating the Pughe team on bringing the Inter-Hospital Cup back to Smithfield after too long an interval, Dr Drysdale remarked on the change which seemed to have come over students since the war, they not only worked harder nowadays but played harder The toast was responded to by Sir Herbert Cohen and the senior physician, Dr H Morley Fletcher who are joint treasurers of the Medical College The health of the guests was proposed by Sir Archibald Garrod, who prefaced his speech by admitting that he was himself a guest that evening, though he was never likely to forget that for forty years the chief interests in his life had centred round Smithfield This toast was responded to by Mr C J Ritchie, Master of the Merchant Taylors' Company and by Sir Walter Fletcher, Secretary of the Medical Research Council, who expressed his pleasure in watching the successful way in which his own hospital was keeping abreast of the demands of modern scientific medicine, he named, in particular, the good work of the 'Radium Team" The chairman's health was proposed by Mr W T Holmes Spicer, senior ophthalmic surgeon, who spoke of Dr Drysdale's devotion to St Bartholomew's and its students, and the regard in which he is held by colleagues and pupils The toast was received with enthusiasm Dr Drysdale ended his acknowledgement by asking the company to drink the health of the secretaries of the dinner—Sir Charles Gordon-Watson and Mr Reginald M Vick—who each briefly replied, the former taking that opportunity to give an account of the proposals for the St Bartholomew's war memorial

ST MARY'S HOSPITAL

ANNUAL DINNER

The annual dinner of the past and present students of St Mary's Hospital Medical School was held on October 6th at the Connaught Rooms, Great Queen Street The chairman, Dr E M Callender, C B E, was supported by Sir Humphry Rolleston, President of the Royal College of Physicians, Mr A P Prideaux, chairman of St Mary's Hospital Board, Sir William Willcox Sir Anderson Critchett, and the Mayor of Paddington amongst many other Proposing the toast of the continued prosperity of St Mary's Hospital and Medical School Dr Callender gave many interesting reminiscences of "forty years ago" He recalled the consternation caused in the dispensary by the house physician who, at the behest of his Latin loving chief when in need of a tent and steam kettle for a bronchitic patient commenced his prescription *nabeat tabernaculum"* Affectionate and humorous memories of Sir William Broadbent Braxton Hicks Walton Edmund Owen, and others blended with tales of hospital life in the days before the period of expansion had set in Mr A P Prideaux replying gave an account of the present happy position of St Mary's Hospital in that it was doing something more than paying its way The equipping of the new ray department and the installation of new lifts was a most satisfactory achievement and he now held out the possibility of improvements and extension of the operating theatres Dr C M Wilson dean of the medical school spoke of the losses they had sustained in the departure of Mr Clayton Greene and Dr E H Kettle He said that the entry for the current year was particularly good in all respects and the prospect for the future very bright Sir Anderson Critchett proposing the health of the chairman, referred to the great honour that had been conferred upon Dr Callender by his being elected president of the Medical Society of London

ROYAL COMMISSION ON LUNACY AND MENTAL DISORDER

OPENING SESSION

THE first meeting of the Royal Commission on Lunacy Law and Administration and Mental Disorder was held at Old Palace Yard, Westminster, on October 7th The Right Hon H P Macmillan, K C , presided The names of the members of the Commission and the terms of reference were published in last week's JOURNAL (p 633)

SIR FREDERICK WILLIS, chairman of the Board of Control, was the first witness, but DR C HUBERT BOND and MR S J FRASER MACLEOD, K C , two of the Commissioners, sat with him and also answered questions

The CHAIRMAN, MR MACMILLAN, said that he was anxious at the outset to appreciate the principles upon which lunacy law had developed It seemed to him to exhibit the reconcilement, as far as possible, of the liberty of the individual with the protection of the public against an abnormal individual and of that individual against the consequences of his abnormality On the medical side there had been a progressive endeavour to ameliorate the conditions under which those of unsound mind were detained, and to aid their recovery

SIR FREDERICK WILLIS said that he believed the work of the Board of Control had largely resulted in bringing mental hospitals into their present state of efficiency, but, of course, there had also been a general growth of a better spirit throughout lunacy administration In addition to the Board, the Lord Chancellor had an ancient jurisdiction, more particularly with regard to the property of insane persons, the Home Secretary had jurisdiction over criminal lunatics, and the Minister of Health had a general responsibility for the provision of mental hospitals The patients with whom the Board had to deal resolved themselves into two categories private and rate aided On January 1st the total number of persons under care for mental disorder in England and Wales was 130,334, of whom 103,892 were in county and borough mental hospitals, 11,323 in Poor Law institutions 2,139 in registered hospitals (institutions not run for profit), 1,187 in metropolitan and 1,610 in provincial licensed houses, 171 in naval and military hospitals, 785 in criminal lunatic asylums, 5,266 in hospitals under the control of the Metropolitan Asylums Board, and 417 in private single care in addition 3,544 insane persons were receiving outdoor relief Boarded out cases, which were very few in number, were included in the first of these categories, the names of the patients still remaining on the books of the mental hospitals The licensed house had been discouraged It had been enacted that the number of these institutions should not exceed the number in existence at the time of the passing of the Act in 1890, and as the licences lapsed the number diminished

MR MACLEOD, on the Chairman's request, gave an account of the process by which respectively a private patient and a rate aided patient came under detention With regard to medical certificates, two were required in the case of a private patient, these must be given by qualified medical practitioners who were not related to the applicant for the order, and whose examinations were of recent date (within seven days) and had been made separately The certificate must state what had been observed by the medical man himself as distinct from what he had been told by other people One of the certifying medical men should be the usual medical attendant of the patient, or if this was not the case the fact must be stated on the document and the reason given When these documents reached the Board of Control they were subjected to a careful scrutiny, first by an experienced clerk and then by a Commissioner Sometimes the certificates did not contain a sufficient statement of the facts observed by the certifier, and in that case they were sent back, and if they could not be amplified or amended the order for detention fell to the ground The Commissioners also sometimes formed the view that the facts which the certifier stated as having led him to the conclusion that the person was of unsound mind did not justify that conclusion, but this did not occur in any substantial number of cases He supposed that the documents which came to the Board related, on the average, to about 100 fresh cases a day, in perhaps 12 or 20 cases the documents would be put aside for further scrutiny, generally, however, on some technical point, though a few came in for criticism on substance A certificate in need of amplification or amendment was sent back to the certifying doctor, who was entitled again to see the patient, now in an institution, but not to add to the certificate matters arising since the date of his original examination

The CHAIRMAN asked whether, in the event of medical certificates not being amended to the satisfaction of the Board the Board directed the discharge of the patient SIR F WILLIS said that in that case the Board told the medical superintendent that the case should be discharged, and it was discharged, but this happened rarely, probably not once in a year

DR BOND said that many medical men found great difficulty in certification Often it was impossible for the Commissioners examining the document to make out whether the certifier had himself observed at the time of examination the facts which he related In other cases the facts set down did not necessarily indicate unsoundness of mind The scrutiny of the Board was directed to the whole certificate, but the accent was on the paragraph relating to the facts observed at the examination Of course, the Commissioners knew from experience that in certain difficult cases it was not possible to base the decision on the facts observed at the time of examination, and here the facts communicated to the certifier by other people must also be taken into account The CHAIRMAN asked whether the forms were subjected to a purely medical scrutiny DR BOND said that this was not the case, but if one of the legal Commissioners was examining the forms and came upon a medical issue he referred it to his medical colleague DR Bond added that he thought the prescribed form could be said to be successful If there was difficulty it was due to the fact that medical men did not always grasp the essential of certification—that of precisely setting out the facts on which conclusions were based But there had been improvement, especially since some of the medical bodies had established diplomas in psychological medicine, and this was reflected in the certificates

The CHAIRMAN remarked that the profession had now been well educated in filling up forms of all sorts

DR BOND went on to give particulars of the reports which had to be furnished by the medical superintendent after the admission of the patient The first report had to be furnished not later than seven days nor earlier than two days after admission A diagnosis was not asked for, but a description of the case, and, in particular, a note of any marks of bodily injury

MR MACLEOD then described the legal process in the case of rate aided patients Here any magistrate could give the order (not a selected justice, as in the case of the private patient), but he was required to see the patient (the selected justice need not do so), and there was only one medical certificate instead of two The private patient was apparently protected more than the rate aided patient because it might be imagined that there were occasionally interests at work to deprive a person who would be in the position of a private patient of his liberty, and these interests would not act in the case of the rate aided patient In the experience of the Board the safeguards for the rate aided patient were, however, sufficient All the documents relating to both classes of patients were scrutinized in the same way A report at the end of a month's detention, which was required in the case of the private patient, was not required in the case of the rate aided, but the requirement as to yearly reports applied to all patients About 800 reports a week were received by the Board and carefully scrutinized

The CHAIRMAN said that apparently these reports were the justification for the continued detention of the patient, and he asked whether it was ever found that the special reports did not justify the original certificate MR MACLEOD said that he did not recall such a case The CHAIRMAN remarked that the importance of the periodical reports was that they served to bring up a case formally for review SIR F WILLIS said that the real safeguard for the patient was not any system of documentation, but the high character and ability of the officers of mental hospitals DR BOND added that in any case in which there was a scintilla of doubt the Board called for a further report after a definite period, and this was closely examined

MR MACLEOD went on to describe the visitation system County and borough mental hospitals were visited once a year by two Commissioners as well as, once every two months, by members of their own visiting committees The guardians had a right, and were encouraged, to visit cases coming from their union, but there was no obligation Licensed houses were visited twice a year by the Commissioners and four times a year by visitors appointed by justices at quarter sessions Registered hospitals were visited under statute once a year by the Commissioners, but in fact twice The Lord Chancellor's Visitors visited those patients who had been judged of unsound mind by inquisition and those in whose property the Lord Chancellor had some concern The total number of persons visited by the Lord Chancellor's Visitors would be about 700 The statutory visit of the Commissioners to the county and borough mental hospitals must be made by a legal and a medical Commissioner together, and must be without previous notice He described the full inquiries which were made Every patient was seen and spoken to, and complaints were received, but it was more customary, especially in the case of convalescent patients, to receive appreciations

The CHAIRMAN asked what opportunities the patients had for private interviews with the Commissioners Mr MACLEOD said that private interviews were always given if asked for, except in the case of dangerous patients

Dr BOND in reply to a question by Sir DAVID DRUMMOND, said that the time given to the visit was certainly not sufficient to satisfy the aspirations of a medical Commissioner, but he thought the time was sufficient to make the visit effective More and more the Commissioners were appealed to by the officers for guidance and personal advice in the conduct of the hospital Every patient was spoken to but, of course, a large proportion of patients were suffering from secondary or other forms of terminal dementia, and in these and some other cases of more acute excitement it was seen to be quite useless to attempt to draw the patients out Therefore it was possible to see a very large number of patients in an institution in a comparatively short time

On the second day of the inquiry evidence was given by the Ministry of Health and the Lord Chancellor's department

THE PROBLEM OF MATERNAL MORTALITY

CONFERENCE IN LONDON

AN interesting conference, organized by the Post Certificate School, was held on October 6th at the Royal Society of Arts, when the subject discussed was 'How to reduce the maternal mortality by the co-operation of all the health services concerned"

Dr J S Fairbairn who took the chair, indicated that the subject had been suggested by the recent report by Dr Janet Campbell of the Ministry of Health the speakers for the most part took portions of this report and dealt with them from some particular point of view The importance of ante natal care was emphasized repeatedly, and Mr Aleck Bourne urged that it was needed by every pregnant woman whatever her class or rank Mr Bourne described the ideal ante-natal clinic as he conceived it, staffed by obstetric specialists, and acting as a consultative centre for the general practitioners in its district but it was pointed out by Dr H Scurfield that outside London ante-natal work was very deficient In rural districts this was especially the case natural shyness appearing to be a terrible obstacle Mr Bourne had suggested that if a woman refused ante natal supervision no practitioner should undertake the case but Miss Liddiard, of the Mothercraft Training School, put the matter in a more practical form by insisting that every woman ought to be educated to demand ante-natal care during her pregnancy

In a letter from Sir Francis Champneys, which was read by the chairman at the beginning of the meeting one of the points raised was that in every case of death in childbed the person actually concerned in the delivery of the woman should be the subject of studied attention Speaking from the point of view of the general public, Mrs Bruce Richmond said that while midwives were bound by their regulations to maintain a certain standard of cleanliness and asepsis, doctors were often very lax in this respect She suggested that the General Medical Council should bear this point in mind, and in this respect Sir Francis Champneys's suggestion was particularly pertinent When a woman died in childbed as much investigation was required as if she had died from small pox was another point urged by Mrs Bruce Richmond in the course of a very effective speech she pleaded for 'better doctors, better midwives, and more of them" insisting that midwives ought to receive a more honoured place as member of an important profession Speaking as a general practitioner Dr J W Wayte of Croydon described the co-operation necessary between the midwife and the doctor All midwives should be fully trained and a full nurse's training was also desirable—a point emphasized by later speakers He urged that in every confinement a doctor and a midwife should both be available, although both need not necessarily be present It was obvious that this would necessitate further financial provisions and Dr L F Pilgrave of Ealing made one reference to this in dealing with the work of the local supervising authorities He deprecated the flat-rate system of payment under the 1918 Act of doctors called in by midwives but he also dealt with the wider aspects of the co-operation between the doctor, the midwife, and the local authority insisting that this co-operation must be close and cordial In the inspection of midwives the instructional element should always be kept well to the fore, and refresher courses were eminently desirable The handywoman was severely criticized by several of the speakers, and it appeared obvious that further legislation was desirable to curtail her activities if not to abolish them completely

A novel aspect of the problem of maternal mortality was dealt with by Dr L W G Malcolm who described the increasing activity of Poor Law institutions in providing facilities for confinement cases In the present state of the housing problem much of the danger of this could be avoided by arranging for confinements to be dealt with in hospitals, and several interesting schemes were indicated for removing the stigma which hindered the use of the many beds in Poor Law institutions which were available for maternity work Ante-natal care, close co-operation between the authorities and services concerned with maternity work and provision of increased hospital accommodation would, however all be useless without the education of the public to realize the importance of the problem of maternal mortality This was the text of Miss Liddiard's remarks who urged that the present generation ought to be approached through women's institutes and clubs throughout the country, the coming generation of mothers should receive instruction at school in mothercraft and all it meant Fathers also, should receive instruction as was urged by several of the later speakers Miss Liddiard suggested that the barrier of shyness might be broken through in rural districts if midwives would settle in one place, and by their devoted lives seek to win the confidence of those around them All women must be encouraged to view motherhood in its proper light as the grandest of the professions"

During the very interesting general discussion the importance of holding autopsies on all women dying in childbed was stressed by several speakers These, it was argued should be conducted by experts and in this way much useful information might be brought to light Another point raised was that of the need of closer co-operation between the medical student and the midwife when the former was working on the district Did an inexperienced student actually do harm? This and other questions would probably be answered, as the chairman remarked in his summing up, if in every case of death during childbed the person who actually delivered the woman could be ascertained

Dr William Paterson of Willesden represented the British Medical Association at the conference which was well attended by doctors, midwives health visitors and others The stimulating discussion should help towards promoting the necessary co-operation between all the health services by which this great national problem of maternal mortality may one day be solved

England and Wales

CARDIFF ROYAL INFIRMARY

SIR EWEN MACLEAN M.D. Hon. Surgeon Gynaecologist to the Cardiff Royal Infirmary and Professor of Obstetrics and Gynaecology in the Welsh National Medical School has presented a thousand guineas for the endowment of a bed in the Thompson ward of the infirmary in memory of his mother who had always been interested in the work of the institution No condition is attached to the gift Sir Ewen Maclean hopes that in the expenditure of money the council will have a free hand to meet any special requirement of the hospital or gynaecological department

RETIREMENT OF DR F W HOPE

In a report presented to the Liverpool Corporation in the autumn of 1873 by Dr William Trench the medical officer of health it was stated that no deaths from [illegible]

fever had occurred in the previous week in Liverpool, an exemption which had not happened for twenty-five years, the last instance of typhus not appearing in the weekly mortality returns having been as far back as 1848. The editorial comment in the journal[1] from which this information has been gleaned was

"All who are acquainted with the insanitary condition of some parts of this populous town will congratulate Dr. Trench upon this striking proof of what can be accomplished by energetic and constant medical inspection."

Ten years later Dr. E. W. Hope was appointed deputy medical officer of health to Dr. Stopford Taylor, who succeeded Dr. Trench, and on the retirement of Dr. Taylor, in 1894, Dr. Hope was elected senior medical officer. For more than forty years, therefore, he has been completing the reforms begun by his predecessors, and has initiated many others with a zeal and perception of the future needs of the community which stamp him a reformer of the first rank. In his annual report for 1921 he gave an account of the sanitary condition of the city as he found it in 1883. The population was 540,000 and the deaths in that year numbered 15,000. In 1921 there were less than 12,000 deaths among a population of over 800,000. In the earlier year there were 20,000 houses and 24,000 cellar dwellings wholly unfit for human habitation. Receptacles for refuse consisted of deep pits or trenches, extending from one end of a street to the other, and it was found to be unsafe to empty them during the summer months, since the process was invariably attended by an excessive destruction of infant life. There was no municipal isolation hospital, the workhouse hospitals being the only institutions available for the isolation of infectious disease. The sanitary staff was quite inadequate and the personnel had had no special training in their duties. There was no port sanitary administration and no check or hindrance on the importation of infectious disease. No side of Dr. Hope's administration has been carried out more carefully and energetically than that connected with the port, and he is quite justified in his statement that—

"the Liverpool Port sanitary organization is to-day as complete as careful organization can make it, and thoroughly fulfils the needs of those important international obligations which have been entered into by most of the maritime nations who recognize that the public health is an important international matter and not a mere local affair."

The supervision and control of food supplies was negligible, the medical inspection of school children was unthought of, and no special attention was paid to the welfare of young children or of their mothers. In 1883 the Society for the Prevention of Cruelty to Children was established in Liverpool, and it subsequently became the National Association. Dr. Hope truly states that the title of the association and the title of the Child Welfare Association of to-day sufficiently indicate the advance in public opinion, in regard to children, in the interval. The gulf between the prevention of actual cruelty and the active promotion of child welfare is a wide one. Very early in his public health career Dr. Hope recognized the importance of creating a favourable public opinion in support of public health reforms, and much of its success is due to his carefully worded reports and to the sound advice contained in them. He would be the first, also, to acknowledge the support he has invariably received from his professional colleagues, not only in Liverpool but throughout the country. He is an ex-president of the Liverpool Medical Institution, and in 1913 was president of the Public Health Section of the British Medical Association at the Annual Meeting at Brighton. In 1912 he was president of the Society of Medical Officers of Health, when he delivered an opportune address on 'the expanding scope of sanitary administration." We understand that Dr. Hope is not relinquishing his association with the Liverpool University as professor of hygiene, or with other universities and examining bodies as an examiner in public health.

After-care of Mentally Defective Children

The City of Birmingham Education Committee has had a subcommittee devoted to the after-care of mentally defective children since 1901. The report for 1923 has now been issued.[1] The duty of the committee includes the keeping of a record of the subsequent histories of former pupils of the special schools for the mentally defective in the city and assisting them to find employment. It also looks after children notified under the Mental Deficiency Act but who are not in institutions. Last year it supervised 803 such children. Of these, 350 had been in no school, they were mainly idiots or imbeciles, but there were some who were deemed educable for whom accommodation had not been found. In some districts of the city children have to wait fifteen months to two years for a place in a special school. Nearly 2,000 male persons who were over school age were under observation, about 35 per cent. were doing remunerative work, 13 per cent. were at home and useful, 11 per cent. were in institutions, and 25 per cent. had been lost sight of. There were fewer women, and a greater proportion doing useful work at home. The report states that "Some people have been known to allege that all criminals are mentally defective, and others that all mental defectives have criminal tendencies, but they fail to substantiate their statements. An examination of the records of the committee, extending as they do over a period of twenty-one years, and relating to more than 3,000 defectives, shows that except for certain cases of immoral conduct, and others of petty thieving, criminal offences have been few."

Certain of the female defectives are quite unable to protect themselves from sexual dangers, and during the past year four such persons had given birth to an illegitimate child. The wisdom of providing adequate care in suitable institutions at a sufficiently early age for young women who need protection in this direction is manifest, and the expenditure involved would be true economy. Most of the cases under the care of the committee fall within the ages of 16 to 27 years. Records are kept of marriages and progeny, 185 families have been noted. Most of the children are very young at present, but it has already been recorded that the three children of one of the men appear to be mentally defective, and of the four children of one of the women two are attending a special school and the two younger ones are said to look far from normal. Trustworthy evidence on these lines would help to convince public opinion of the necessity for denying parenthood to the mentally unfit.

Scottish Board of Health Consultative Councils

The Scottish Board of Health announces that it has made the following new appointments to its several consultative councils:

Medical and Allied Services: Professor J. R. Currie, M.D., Glasgow University; Mr. A. Gofton, F.R.C.V.S., Chief Veterinary Inspector, Edinburgh; Dr. G. R. Livingston, Dumfries; and Professor B. P. Watson, M.D., Edinburgh University.

National Health Insurance (Approved Societies Work): Mr. J. G. Barry, Glasgow, Miss Jean Coutts, Aberdeen, and Mr. Jobson, Stirling.
